## INTRODUCTION

In 1970, there were about 4000 African American lawyers in the United States. Today there are more than 40,000. The great majority of the 40,000 have attended schools that were once nearly all-white, and most were the beneficiaries of affirmative action in their admission to law school. American law schools and the American bar can justly take pride in the achievements of affirmative action: the training of tens of thousands of African American (as well as Latino, Asian American, and Native American) practitioners, community leaders, judges, and law professors; the integration of the American bar; the services that minority attorneys have provided to minority individuals and organizations once poorly serviced by white lawyers; and the educational benefits that law students of all backgrounds derive from studying in a racially diverse environment.<sup>1</sup>

But not every student admitted through affirmative action realizes his or her ambition to practice law. Of the African American students who entered law school in the fall of 1991, the one year for which we have good data, about 43% either did not graduate or graduated but had not passed a bar exam within two years of graduation. Only 17% of the white students in the 1991 cohort suffered either of these fates.<sup>2</sup>

In *A Systemic Analysis of Affirmative Action in American Law Schools* (*Systemic Analysis*), Professor Richard Sander argues that if affirmative action were eliminated in law school admissions, the rate at which African American students fail to graduate and pass the bar would be reduced substantially without any concomitant loss in the numbers of African Americans joining the

1. Professor Charles Lawrence describes these achievements as the “forward-looking purpose” of affirmative action, which involves “preparing students for the work of fighting the disease of racism and creating a better world.” Charles R. Lawrence III, *Each Other’s Harvest: Diversity’s Deeper Meaning*, 31 U.S.F. L. REV. 757, 765-66 (1997).

2. Richard H. Sander, *A Systemic Analysis of Affirmative Action in American Law Schools*, 57 STAN. L. REV. 367, 454 (2004).

bar.<sup>3</sup> He acknowledges that fewer African American students would be admitted to law school, but predicts that those who were admitted would graduate and pass the bar at much higher rates because they would no longer be attending schools where the competition was too stiff for them. Sander builds to an astonishing forecast: “that the number of black lawyers produced by American law schools each year and subsequently passing the bar would probably increase if those schools collectively stopped using racial preferences.”<sup>4</sup> In particular, he predicts that the cohort entering law school in 2001 would have produced 7.9% more new black lawyers entering the bar.<sup>5</sup>

We agree with Sander that the high rate at which African American students fail to graduate and fail to pass the bar is alarming.<sup>6</sup> Indeed, we take the problem so seriously that despite the high value we place on racial diversity within law schools, the four of us would not support affirmative action as currently practiced in law school admissions if we believed that employing race-neutral admissions criteria would in fact lead to a net increase in the number of African Americans passing the bar.<sup>7</sup> We find, however, that while Sander has appropriately forced us and others to take a hard look at the actual workings of affirmative action, he has significantly overestimated the costs of affirmative action and failed to demonstrate benefits from ending it. The conclusions in *Systemic Analysis* rest on a series of statistical errors, oversights, and implausible assumptions. It is these empirical shortcomings that we address in this Response.

The next Part of the Response deals step-by-step with the process of becoming a lawyer, from application, admission, and enrollment in law school through graduation and sitting for the bar exam. At each stage we explain why the findings and claims in *Systemic Analysis* are not supported by the data. We conclude that if affirmative action was ended, there would be a substantial net decline in the number of African Americans entering the bar rather than the 7.9% increase that Sander forecasts. We cannot say precisely how severe this decline would be, but our best estimate is that it would be in the range of 30% to 40%.

---

3. *Id.* at 474-77.

4. *Id.* at 474.

5. *Id.* at 473 tbl.8.2.

6. We have been concerned about African American dropout and bar failure rates long before publication of Sander's article, and two of us had written on this issue before knowing of Sander's work. See David L. Chambers, *Who Gets In? The Quest for Diversity After Grutter*, 52 *BUFF. L. REV.* 531, 569-76 (2004); Timothy T. Clydesdale, *A Forked River Runs Through Law School: Toward Understanding Race, Gender, Age, and Related Gaps in Law School Performance and Bar Passage*, 29 *LAW & SOC. INQUIRY* 711 (2004).

7. Like Sander, we would still likely support the degree of affirmative action needed to ensure there was not a virtual absence of African American students at any law school.

In the final Part, we shift to a related question: without affirmative action, how would African Americans be distributed across the range of American law schools? Sander acknowledges that the numbers of African Americans at the dozen or so most elite schools would be reduced by at least three-fourths, but expects that most other schools would have as many African American students as they do today. We disagree. We believe that the numbers of African Americans would decline substantially at the great majority of the nation's fifty to eighty most selective law schools and expect that this decline would be followed in turn by a decline in the number of African Americans attaining the sorts of leadership positions that graduates of these schools attain today.

As we begin, we want to emphasize the limited scope of our Response. First, Sander confines his analysis to African Americans, and we have done the same. His findings and ours might be quite different for Latinos, Native Americans, and other groups that have benefited from affirmative action. Second, Sander addresses more aspects of the affirmative action system than we examine here. We focus solely on the likely consequences of ending affirmative action because we agree with Sander that it is a "central question."<sup>8</sup> Indeed, it is almost certainly *the* central question of interest to policymakers and the public that his article raises. We want to make clear, however, that our silence on other claims Sander makes, such as his claims regarding the evidence before the Court in *Grutter v. Bollinger* on the University of Michigan Law School's admissions procedures<sup>9</sup> or his analysis of the job market for African American graduates,<sup>10</sup> does not mean that we agree with Sander. Had we been allowed more space, we would have disputed aspects of these claims as well.

Indeed, space prevents us from being as detailed as we would like in dealing with some aspects of *Systematic Analysis* we do address. For those

8. Sander, *supra* note 2, at 468.

9. For a response to claims much like those Sander makes about the University of Michigan Law School's admission system, see the expert testimony of Stephen Raudenbush which was offered in *Grutter*. Testimony of Stephen W. Raudenbush, *Grutter v. Bollinger*, 137 F. Supp. 2d 821 (E.D. Mich. 2001) (No. 97-CV-75928-DT), available at <http://www.umich.edu/~urel/admissions/legal/grutter/gru.trans/gru1.19.01.html>.

10. See Michele Landis Dauber, *The Big Muddy*, 57 STAN. L. REV. 1899 (2005); David B. Wilkins, *A Systematic Response to Systemic Disadvantage: A Response to Sander*, 57 STAN. L. REV. 1915 (2005). Sander's discussion of law-graduate earnings in the second year after law school rests on his analysis of data from the "After the JD" study, in which he has participated as a member of the steering committee. Sander, *supra* note 2, at 456-62. His partners in the study have done their own analysis of the same data and believe that Sander significantly overstates what the data show. Statement of Ronit Dinovitzer, Bryant Garth, Bob Nelson, Joyce Sterling, and Gita Wilder, to the authors (Feb. 15, 2005). We will add this statement to the website where the Web version of our Article is posted. See note 11 *infra*. So far as we could find, none of Sander's After the JD collaborators agrees with his conclusion that affirmative action produces for most African Americans a significantly harmful earnings tradeoff between prestige and law school grades.

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1859

readers who desire a finer-grained analysis, we have created a longer version on the Web.<sup>11</sup> It is on the Web also that we will respond point by point to the counterclaims that Sander makes in this issue.

I. THE EFFECTS OF ENDING AFFIRMATIVE ACTION ON THE PRODUCTION OF  
AFRICAN AMERICAN ATTORNEYS

A. *The Effects on Law School Applications, Admissions, and Matriculation*

Part VIII of *Systemic Analysis* estimates the impact on African American enrollments in law school if affirmative action were ended tomorrow.<sup>12</sup> Sander's estimate is built of the following steps: (1) an assumption that there would be no decline in African American applications to law school; (2) an estimate that there would be only a 14% decline in the numbers of African American applicants who would be admitted to at least one school and an assumption that those eliminated would be the 14% of current African American law students with the lowest entry credentials; (3) an assumption that among those admitted, African Americans would maintain current matriculation rates (i.e., that "cascading" to lower schools would not reduce the rate at which admitted African Americans chose to enroll in law school); and hence, (4) a forecast that there would be only a 14% decline in the total number of African Americans matriculating in American law schools. We believe each of these assumptions and predictions is unsound, and that all of them err in the direction of overestimating the probable levels of matriculation by African Americans.

Sander rests his conclusion that ending affirmative action would produce only a 14% decline in African American matriculation to law school on the research of Linda Wightman, who directed the Bar Passage Study for the Law School Admission Council (LSAC).<sup>13</sup> Using what she referred to as the "grid" method, which applies white admission rates to African Americans with similar LSAT scores and similar undergraduate grade point averages (UGPA), Wightman concluded that, in 2001, if African American law students had been admitted in the same proportions as whites with similar credentials, 14% of the African American students who received at least one offer of admission would

---

11. The longer version of our Response to Sander is available at <http://www.law.umich.edu/CentersAndPrograms/olin/abstracts/05-007.htm> and at <http://www.equaljusticesociety.org>.

12. Sander, *supra* note 2, at 470-75.

13. Linda F. Wightman, *The Consequences of Race-Blindness: Revisiting Prediction Models with Current Law School Data*, 53 J. LEGAL EDUC. 229, 233-34 (2003). Wightman placed all applicants for law school onto a grid arranged by ranges of LSAT scores and ranges of undergraduate grade point averages (UGPA). For each box in the grid, she calculated the percentage of whites who were admitted to at least one law school and applied that percentage to the numbers of African Americans in the same box. *Id.*

not have received any offers at all, even if they had applied to a wide range of schools to which they never actually applied.<sup>14</sup> Sander accepts Wightman's 14% figure as a realistic estimate of the probable decline in African American admissions. For two different sets of reasons, the actual decline in matriculation by African American students would be much greater.

1. *Sander's projections are based on 2001 data, which does not reflect current trends*

Sander bases his predictions on data from the year 2001, which was the most recent year available to Wightman when she wrote her article. While Sander treats 2001 as representative of what would happen if affirmative action ended at law schools today,<sup>15</sup> no single year can serve that function. Further, 2001 turns out to have been one in a group of adjacent years when white and overall application levels to law school were comparatively low.

In Table 1, we provide for each year from 1991 through 2004 grid model estimates based on exactly the same procedure that Wightman used for 2001.<sup>16</sup> The table reveals that the projected size of the decline in African American admissions in any given year is strongly tied to the size of the overall applicant pool. It is, in particular, tied to the volume of applicants with high LSATs and UGPAs.<sup>17</sup> In the "dot com" boom years of 1997 through 2001, young white

---

14. Sander describes Wightman's approach in detail in his article. Sander, *supra* note 2, at 471-72. By using the grid, Wightman's model indirectly takes into account the factors other than grades and LSAT scores that affect admissions decisions. Wightman also employs a second, logistic regression approach to determine what proportion of African American students could still get into the very law schools to which they actually applied. Using this approach, she found that in 2001 there would have been a 38% decline in African Americans receiving admission offers. Wightman, *supra* note 13, at 243 tbl.7. Sander dismisses this second approach as "nonsensical" for estimating the effects of ending affirmative action because he believes that if affirmative action ended, African Americans would no longer apply only to the schools that they did in the past. Sander, *supra* note 2, at 471 n.275. This objection assumes that even the "safety" schools these students applied to were more selective than the schools that would attract these applicants today.

15. Sander, *supra* note 2, at 475-78; *see also* Richard H. Sander, *House of Cards for Black Law Students*, L.A. TIMES, Dec. 20, 2004, at B11.

16. The data for 2001 and 1991 are from Sander, *supra* note 2, at 472 tbl.8.1 (citing Wightman, *supra* note 13, at 243 tbl.1). The data for 1992-2000 and 2002-2004 are our grid model calculations for all applicants reporting LSAT and UGPA, based upon LAW SCH. ADMISSION COUNCIL, NATIONAL DECISION PROFILES, 1992-2004 (data available upon request from the LSAC Data Management Department).

17. For example, in 2001, 1923 African American applicants were admitted to law school with LSATs between 140 and 149. Without affirmative action, the grid model suggests that about 1552 of the 1923 (80.7%) could still have secured admission to some law school. In 2004, 1625 African American applicants with 140-149 LSATs were admitted to law school, but the grid model predicts that only 837 (51.5%) would have been admitted without affirmative action. What happened between 2001 and 2004 was a huge increase in the numbers of applicants to law school with LSATs above 149. In 2004, there were 13,344

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1861

college graduates in much larger than usual numbers took jobs or pursued other schooling opportunities rather than apply to law schools. While African American applications to law school grew slightly during this period, total applications to law schools declined from a high of 99,000 in 1991 to a low of 72,000 in 1998. By 2001, they had risen slightly to 77,000, and, by 2004, they had returned to the levels of 1991.

TABLE 1: "GRID MODEL" ESTIMATES FOR EFFECTS ON AFRICAN AMERICAN LAW SCHOOL ADMISSIONS OFFERS FROM ELIMINATING AFFIRMATIVE ACTION, 1991-2004

Year	Size of the Overall Applicant Pool	# of African Americans Actually Offered Admission at ABA-Accredited Law Schools	Projected # of African Americans Admitted to Some ABA-Accredited Law School Without Affirmative Action	Percentage Change in African Americans' Admissions Offers
1991	99,327	3435	1631	-52.5%
1992	97,719	3587	1810	-49.5%
1993	91,892	3726	2093	-43.8%
1994	89,633	3884	2305	-40.1%
1995	84,305	3750	2554	-31.9%
1996	76,687	3583	3105	-13.3%
1997	72,340	3535	3212	-9.1%
1998	71,726	3790	3388	-10.6%
1999	74,380	3743	3379	-9.7%
2000	74,550	3649	3206	-12.1%
<b>2001</b>	<b>77,235</b>	<b>3706</b>	<b>3182</b>	<b>-14.1%</b>
2002	90,853	3706	2998	-19.1%
2003	99,504	3565	2705	-24.1%
2004	100,604	3664	2472	-32.5%

Sources and Notes: 2001 and 1991 data are from Sander, *supra* note 2, at 472 tbl.8.1 (citing Wightman, *supra* note 13, at 243 tbl.1). All other data are our grid model calculations for all applicants reporting LSAT and UGPA, based upon LAW SCH. ADMISSION COUNCIL, *supra* note 16. Wightman's estimates for 1991 and 2001 are from slightly smaller samples than our grid model estimates, and all the grid model estimates exclude applicants without LSATs and UGPAs, so the figures are not exactly comparable to overall LSAC or ABA data on matriculants, contra Sander's Table 8.2. The 2004 data became available in late December 2004 upon request from the LSAC, after the *Systemic Analysis* article was in press.

In 2004, as Table 1 shows, we estimate that ending affirmative action would have cut by about 32.5% the numbers of African Americans who would have been admitted to any accredited law school. Because of improvements in

more white and African American applicants with LSATs above 149 than there had been in 2001, but the ratio was about 20 whites for every 1 African American.

African American entry credentials over the years and a small increase in the number of law schools, the projected decline for 2004 is smaller than the projection had been in 1991, when total applications were about the same, but 32.5% is still an enormous reduction, much higher than the estimate of 14% for 2001. The overall pattern from 1991 through 2004 suggests that the impact of ending affirmative action on potential African American admissions to law school would vary across years, but that in most years the negative impact would be substantially greater than it would have been in 2001. Indeed, the numbers lost would be so great that even if Sander were correct that the remaining black students would graduate and pass the bar at the same rate as their white classmates (and we explain later why he is not), there would have been a net loss in 2004 of about 21% in the number of African American lawyers produced under Sander's model, and from early indications, nearly the same loss in 2005 as well.<sup>18</sup>

*2. Sander overestimates the numbers of African Americans who would apply to law school, get into the law school to which they would apply, or choose to enroll*

The grid model is useful solely for suggesting how many African Americans might have been admitted to some law school somewhere without affirmative action, *if* they had chosen to apply to the school that would admit them. It offers an upper-bound estimate of the numbers of African Americans who could enter law school under race-neutral criteria.<sup>19</sup> Wightman, from whom Sander borrowed his grid approach, made clear that the grid model cannot tell us whether African American students would actually apply to significantly lower-ranked law schools to which they never applied in real life, and she cautioned against the very use Sander makes of the model's approach.<sup>20</sup> Nor can the grid model tell us whether African Americans, even if

---

18. Regarding estimates for 2005, the number of persons taking the LSAT have proven a good proxy for application trends, and in 2004, the June, October, and December LSATs combined (people applying for 2005 entry) had 1% fewer testers than those same three LSAT administrations in 2003, but still 37% more than 2000 (2001 applicants). Law Sch. Admission Council, Tests Administered (2004), available at <http://www.lsacnet.org/LSAC.asp?url=lsac/data/applicant-data.htm>.

19. The grid has other limitations. Among them is the fact that the results of the grid model turn in part on the number and size of the cells in the grid. In the grid Wightman (and Sander) used, for example, each cell includes a range of 0.25 of a grade point in undergraduate grades and a range of 5 LSAT points. These large cells (each has a range of 75 points on Sander's 1000-point index) almost certainly lead to a slight overestimation of the number of African American applicants who would be admitted, given the probable African American-white distribution of index scores within any given cell.

20. Linda F. Wightman, *The Threat to Diversity in Legal Education: An Empirical Analysis of the Consequences of Abandoning Race as a Factor in Law School Admission Decisions*, 72 N.Y.U. L. REV. 1, 18, 22-29 (1997).

their law school aspirations were not dampened by the diminished prestige of the schools they might attend, would successfully identify and apply to schools that would admit them. In short, the grid model cannot provide even a loose estimate of how many African Americans would in fact matriculate in law school, but Sander, though recognizing that the model cannot tell us what African Americans would actually do, in the end treats it as if it does.<sup>21</sup> We no more than Sander can state precisely how many African Americans would enter law school in a world without affirmative action, but we can offer reasons, supported by evidence and common sense, why the number Sander gives us is a substantial overestimate.

First, Sander incorrectly believes that, if affirmative action were ended, law would remain as appealing to African Americans for a career as it is today. He acknowledges that an African American college student “attracted to the law but not desperate to have a legal career might have second thoughts if she faced the prospect of attending a fortieth-ranked school instead of one ranked fourteenth.”<sup>22</sup> He nonetheless guesses that there would be no decline in law school applications because African Americans will learn of his findings and recognize that they will, in general, have a better chance of passing the bar by going to the fortieth-ranked school.<sup>23</sup> Our estimate is that many of the African Americans who now secure admission to the fourteenth-ranked school could, in the absence of affirmative action, at best expect admission only to a school in the sixtieth- to eightieth-rank range,<sup>24</sup> and we expect that whether it is the fortieth- or the eightieth-ranked school that would admit them, many African Americans who now opt to attend elite law schools will turn to other careers.

Even today, for many African American students applying to law school, other career paths appear to be nearly as attractive as law.<sup>25</sup> A large proportion of applicants to law school (of all backgrounds) are tentative in their commitment to law school, much more tentative than, say, applicants to medical school.<sup>26</sup> Among the respondents to the Bar Passage Study, for example, 54% of African Americans and 52% of whites said that they had

---

21. Sander, *supra* note 2, at 476-77.

22. *Id.* at 476.

23. *Id.* at 476-77.

24. *See* text *infra* Part II.

25. The consequences of ending affirmative action in law school, but not in other graduate and professional schools, are difficult to test empirically. In our Web version of this piece, we discuss the likelihood of especially severe effects on law schools if they were the only educational institutions prohibited from employing affirmative action.

26. The average medical school candidate invests several years of effort into premed courses and applies to a dozen schools. Barbara Barzansky & Sylvia I. Etzel, *Educational Programs in U.S. Medical Schools, 2002-2003*, 290 JAMA 1190, 1192 tbl.3 (2003). By contrast, the average law school applicant applies to only about 5 schools. *See* Law Sch. Admission Council, *National Applicant Trends, 2003-04 LSAC REPORT 1* (showing that between 1991 and 2003, law school applications per applicant ranged from 4.8 to 5.3).

considered applying to graduate and professional programs other than law in the preceding two years. A less robust commitment to applying to law school among African Americans is also evident in that black students apply later in the admissions cycle compared to whites, apply to fewer schools on average than whites (4.2 versus 4.7 in 1999-2003), and take the LSAT later in the admissions cycle.<sup>27</sup> For some African Americans, the ending of affirmative action would probably be the “tipping point” away from law school and toward other career paths.<sup>28</sup>

Even those African American students who could still get into one of the nation’s most selective law schools might find attending law school less attractive than they do today. By Sander’s own estimates, without affirmative action African Americans would constitute only about one to two percent of the student bodies at the most elite law schools.<sup>29</sup> Today, the top thirty law schools in *U.S. News & World Report (U.S. News)* have student bodies that are, on average, 8.1% African American (excluding the three schools where affirmative action has been prohibited by law).<sup>30</sup> Many African American students care about attending a law school that has other minority students. On the Bar Passage Study survey, 68% of African American students at the two most elite tiers of schools said that the numbers of minority students at the school they were attending was a very important or somewhat important reason for applying.<sup>31</sup> We thus expect that some African American students who could still get into an elite law school will choose not to apply at all, rather than be a part of a tiny minority.<sup>32</sup>

---

27. See Law Sch. Admission Council, *supra* note 26, at 1; Law Sch. Admission Council, *Distribution of Number of Applications per Student (2004)* (data available upon request from Bruce Weingartner at LSAC); see also Jay Rosner, *Disparate Outcomes by Design: University Admission Tests*, 12 LA RAZA L.J. 377, 385 (2001) (expert report of Jay Rosner in *Grutter v. Bollinger*, 137 F. Supp. 2d 821 (E.D. Mich. 2001)). These factors also suggest that the grid model underestimates the impact of ending affirmative action.

28. The figures above on applications in recent years reveal how widely applications swing in response to mild changes in the economy. And as Sander himself notes, “My own unpublished research suggests that a talented young person of any race growing up in a low-to-modest socioeconomic environment has a better chance of reaching the upper-middle class through ordinary capitalism than through a graduate degree, like law school.” Sander, *supra* note 2, at 425 n.165.

29. *Id.* at 483.

30. LAW SCH. ADMISSION COUNCIL & AM. BAR ASS’N, OFFICIAL GUIDE TO ABA-APPROVED LAW SCHOOLS 2003 EDITION 26-35 (Wendy Margolis et al. eds., 2002). Boalt Hall, UCLA, and the University of Texas are excluded. If included, the top thirty schools had 7.4% African American students.

31. While 28% said it was “very important,” 40% said it was “somewhat important.” The percentage was much the same at other tiers of law schools. At the historically black schools, the proportion who said the number of minorities at the school was “very important” to their decision was much higher.

32. Our data indicate a significant relative decline in black law school applications to Boalt Hall, UCLA, UC Davis, UC Hastings, the University of Texas, the University of

Second, Sander assumes that so long as an African American considering law school could get into some law school, she will apply to that law school regardless of where it is in the United States. Although large numbers of law students, including African American students, travel substantial distances from home to attend the nation's most selective law schools, most students who attend lower-tier schools are from the same or an adjacent state.

The question that Sander's imagined future poses is whether African American students now traveling afar to attend relatively prestigious schools would be willing to travel similar distances to attend lower-tier schools. Sander believes the question is of minimal significance because there are plenty of lower-tier law schools in the states where most African Americans already live. While it is true that lower-tier law schools are located throughout the country, we are quite uncertain exactly what admissions landscape African Americans now at higher-tier law schools would face in a world without affirmative action. It is important to remember that if affirmative action ended, African Americans who applied to a nearby lower-tier school with credentials within that school's range that might secure admission will not necessarily be accepted. If race is irrelevant to admissions, the lower their credentials are within the pool of admissible applicants, the more they will have to offer other strong qualities apart from race to secure admission.<sup>33</sup> African Americans who are not admitted to the nearby lower-tier schools will have to turn elsewhere, and a disproportionate number of the lower-tier schools that might have space for them are located in states in the Great Plains, Rocky Mountains, Southwest, Pacific Northwest, and rural New England, where few African Americans go to

---

Houston, and the University of Washington in the late 1990s, immediately following affirmative action bans. Detailed 1996-1998 data from Boalt also show a twenty-five percent drop in black applicants with LSAT scores of 160 or higher. At the undergraduate level in California and Texas, applicant and yield-rate data are more ambiguous. See DAVID CARD & ALAN B. KRUEGER, *WOULD THE ELIMINATION OF AFFIRMATIVE ACTION AFFECT HIGHLY QUALIFIED MINORITY APPLICANTS? EVIDENCE FROM CALIFORNIA AND TEXAS* 25 (Nat'l Bureau of Econ. Research, Working Paper No. 10366, 2004), available at <http://www.nber.org/papers/w10366>. But see SAUL GEISER & KYRA CASPARY, UNIV. OF CAL. OFFICE OF THE PRESIDENT, "NO SHOW" STUDY: COLLEGE DESTINATIONS OF UC APPLICANTS WHO DO NOT ENROLL AT UC, 1997-2002, at 13-14 (2003) (showing that underrepresented minorities are less likely to matriculate in the University of California system, both overall and among those in the top of the applicant pool, a pattern that has become more pronounced since Proposition 209); Mark C. Long, *College Applications and the Effect of Affirmative Action*, 121 J. ECONOMETRICS 319, 325 (2004) (finding that "California's underrepresented minorities significantly lowered their number of score reports sent to in-state, public colleges of all quality levels" and finding "similar, but less striking" results in Texas).

33. Nearly all law schools select their admittees from a large pool of applicants. In 2003, all but four of the 183 ABA-accredited law schools reported rejecting at least half of those who applied. *Schools of Law*, U.S. NEWS & WORLD REPORT, Apr. 12, 2004, at 69-71. Moreover, in every index range from which law schools admit significant numbers of applicants, there are substantially more non-African American than African American applicants.

law school today<sup>34</sup> and where African Americans from other parts of the country may be reluctant to move, especially if the schools in these other locations primarily place their graduates in locations where African Americans are unlikely to want to live and practice.

Third, Sander acknowledges that the availability of financial aid can affect decisions about attending law school, but points to the “After the JD” study to show that African American students receive about three times as much in “grants and aid” from law schools as do students of other races and concludes that financial considerations will not reduce post-affirmative action law school enrollment estimates.<sup>35</sup> His forecast is doubtful. If African American students currently receive grants in part through race-conscious programs not solely related to need, these programs are likely to end with the end of affirmative action. If the reason they receive more grants is because they have greater need, then that need will continue even if affirmative action is ended.

Today, even with the availability of scholarships, more African Americans than whites borrow to attend law school (95% versus 84%), and those who borrow borrow as much on average as white students.<sup>36</sup> Thus, in deciding whether to attend a lower-tier law school, an African American student who could attend a more elite school today is likely to be affected by his estimate of the size his educational debt will be in relation to the earnings he can expect to receive, and the earnings of graduates of lower-tier schools are in general much lower than the earnings of the graduates of elite schools.<sup>37</sup> Sander argues that these status-associated differences would be more than made up for by the

---

34. See *Ranking the Nation's Law Schools According to Percentage of Black Students*, J. BLACKS HIGHER EDUC., Autumn 2001, at 86, 86-87 (showing that there were fifty-two law schools where African Americans were 4.0% or less of the student body, mostly middle- to lower-ranked schools in states or areas with small African American populations, such as Maine (0.8%), Nebraska (1.9%), Oregon (2.2%), and New Mexico (3.5%)).

35. Sander, *supra* note 2, at 477.

36. See RONIT DINOVIETZ ET AL., AFTER THE JD: FIRST RESULTS OF A NATIONAL STUDY OF LEGAL CAREERS 73 tbl.10.1 (2004), available at <http://www.abf-sociolegal.org/NewPublications/AJD.pdf>. Within the BPS, using rough measures of income, parental education, and parental occupational status, Wightman found that 50.7% of African American law students came from lower-middle-class backgrounds, compared to only 22.3% of whites. See Wightman, *supra* note 20, at 42 n.99 tbl.N7. She cites this finding as one reason among many that the grid model is unrealistic. *Id.* at 23-25.

37. The After the JD data set, though not yet available to the public (including us), provides useful information on debt in relation to earnings in a preliminary report. Dividing law schools into five tiers, it found, unsurprisingly, that the median income of recent graduates rises with each tier of law school in the prestige hierarchy. Somewhat surprisingly, however, it also found that debts among those who had borrowed were almost constant across tiers. Most people do not realize that many schools in the lower tiers are as expensive to attend as schools at the top. Thus, between graduates of the first- and fourth-tier schools, there was a difference of more than two to one in median second-year earnings (\$135,000 versus \$60,000) but very little difference in median educational debt (\$80,000 versus \$75,000). DINOVIETZ ET AL., *supra* note 37, at 75 tbl.10.3.

better grades the student would receive at the lower-tier school because grades are more important than prestige in predicting earnings. We strongly doubt his conclusions in this regard, especially as they apply to African Americans attending elite law schools.<sup>38</sup> As David Wilkins points out in this issue, law school prestige is a much more conspicuous long-range signal in the labor market than grades.<sup>39</sup>

We have suggested several reasons why, if affirmative action were ended, fewer African Americans would apply to law school than do today. We also expect that many African Americans who could get in somewhere would apply only to law schools that would not admit them. Even with affirmative action in place, hundreds of African Americans with solid credentials are currently rejected by every school to which they apply.<sup>40</sup> An end of affirmative action, by restricting greatly the range of schools available to most African American applicants, would surely increase the number of futile applications. Thus, Sander's posited national admissions market, where, without affirmative action, the vast majority of African Americans would smoothly "cascade" down a tier or two, is quite implausible.<sup>41</sup> Many African American students who would be admitted to some law school in an imagined world where they would be willing to go anywhere will, in the real world where they choose five or six schools to apply to, see their admission offers diminish from one or two to none.

Thus, abolishing affirmative action would reduce the number of African American law students for two different sorts of reasons. One is that it would exclude students whose LSAT scores and UGPAs are so low that they could not get into a school even if they applied to a broad range of schools. Applicant data from 2004 indicate that this decline would be approximately 32.5% of current African American law students, much more than the 14.1% that Sander forecasts on the basis of data from 2001. A second reason is that some African Americans who could get into some law school somewhere would no longer choose to apply to law school, or would apply only to schools that would not

---

38. See, e.g., Richard O. Lempert et al., *Michigan's Minority Graduates in Practice: The River Runs Through Law School*, 25 *LAW & SOC. INQUIRY* 395, 447-53 (2000); DAVID WILKINS ET AL., *HARVARD LAW SCHOOL: REPORT ON THE STATE OF BLACK ALUMNI, 1969-2000*, at 42 tbls.14-17 (2002); see also note 9 *supra*.

39. Wilkins, *supra* note 10, at 1933-35.

40. In 2004, for example, 422 African American students with LSAT scores of 150 or more were denied admission to all the ABA-accredited schools to which they applied. See *LAW SCH. ADMISSION COUNCIL*, *supra* note 16. In 2003, the figure was 386. *Id.*

41. See Sander, *supra* note 2, at 413. Yet another reason his cascade theory is unrealistic is that the vast majority of the eighty or so public law schools in the United States have student bodies overwhelmingly comprised of in-state residents. At these schools, state legislatures often limit the number of out-of-state students who may enroll, and the out-of-state applicants who are admitted tend to have higher LSATs and UGPAs than in-state students.

1868

STANFORD LAW REVIEW

[Vol. 57:1855]

admit them, or would be accepted someplace but decide not to attend. We cannot calculate the size of this group with precision, but we believe that an additional 10% to 15% or so decline in African American matriculants on top of the 32.5% who would not be admitted is a conservative forecast. We thus estimate a total decline in African American enrollments of around 40% to 50%, about three times greater than Sander's prediction.

*B. The Effects on Law School Performance, Graduation, and Passage of the Bar*

Nearly the entire second half of *Systemic Analysis* is devoted to the claim that African American law students do poorly in law school, on the bar, and in the labor market because they have been going to the wrong law schools.

Using regression analysis, Sander attempts a straightforward tale: Because of affirmative action, African American students arrive at law school with much lower LSATs and UGPAs than their white classmates. Because of their lower credentials, they get lower grades in law school than their white classmates do. Because they get lower grades, they graduate at lower rates than their white classmates and fail the bar at much higher rates. Since at each of these steps, according to Sander, factors associated with being black apart from grades and credentials have no statistical relationship to lower performance, black students would perform as well as whites if they simply went to schools where their entry credentials were like those of the white students. They are, in other words, the victims of a mismatch, affirmative action having seduced them into schools where they are doomed to do less well than they otherwise could. *Systemic Analysis*'s ultimate conclusion is blunt: "by every means I have been able to quantify, blacks as a whole would be unambiguously better off in a system without any racial preferences at all than they are under the current regime."<sup>42</sup>

Sander makes it sound so simple. A leads inexorably to B, and B leads inexorably to C. In fact, Sander misinterprets his own results and vastly overstates what his data show. Examining his case with care and using the same data, we find that eliminating affirmative action would improve neither graduation nor bar passage rates to anywhere near the extent that Sander foresees.

*1. Concerns about statistical methods*

Sander rests all his important claims about black student performance on statistical analyses. If his analyses are inadequate, his conclusions are unreliable. If readers misinterpret the weight they should accord Sander's

---

42. *Id.* at 482-83.

statistical results, they are likely to give more weight to his conclusions than they deserve. Hence we take a brief excursion into some statistical issues, for Sander has significantly overreached in the conclusions he draws from his models.

To begin with, when he discusses the relationship between entry credentials and later outcomes, such as graduation or bar passage, he invites readers to interpret measures of statistical significance as if they were measures of practical significance. Sander writes:

The “t-statistic” tells us how consistent or reliable a relationship is, with a higher t-statistic indicating a stronger, more reliable association. T-statistics generally increase as a function of the standardized coefficient and the size of the sample. T-statistics above 2.0 are usually taken to signify that the independent variable is genuinely helpful in predicting the dependent variable. A t-statistic of less than 2.0 indicates a weak, inconsistent relationship—one that might well be due to random fluctuations in the data.<sup>43</sup>

Sander’s guidance is wrong. T-statistics and their associated significance tests do not in themselves tell us whether a relationship is strong or weak or whether “the independent variable is genuinely helpful in predicting the dependent variable,” at least if what one means by “helpful” is that knowing the independent variable will, to some important degree, improve our ability to predict the dependent variable.<sup>44</sup> Tests of statistical significance can be particularly misleading in large samples where weak relationships can easily be significant.<sup>45</sup> Sander’s Table 6.1, in which he uses logistic regression to predict bar passage in a sample of 21,425 cases, provides a striking illustration.<sup>46</sup> Because 95% of those in the sample who took the bar passed it, if one simply “predicts” that each person in the sample passed, she will be right 95% of the

43. *Id.* at 428-29. Sander then notes, “The ‘p-value’ contains the same information as the t-statistic, but it has a more intuitive, accessible meaning.” *Id.* at 429. Consequently, our criticism relates to Sander’s presentation of p-values and t-statistics.

44. In his classic textbook, Hubert Blalock explains that “[s]tatistical significance should not be confused with practical significance. Statistical significance can tell us only that certain sample differences would not occur very frequently by chance if there were no differences whatsoever in the population. It tells us nothing about the magnitude or importance of those differences.” HUBERT BLALOCK, *SOCIAL STATISTICS* 126 (1960).

45. David H. Kaye & David A. Freedman, *Reference Guide on Statistics*, in *REFERENCE GUIDE ON SCIENTIFIC EVIDENCE* 333, 379 (Fed. Judicial Ctr. ed., 2d ed. 2000) (“Statistical significance may result from a small correlation and a large number of points. In short, the *p*-value does not measure the strength or importance of an association.”); Daniel L. Rubinfeld, *Reference Guide on Multiple Regression*, in *REFERENCE GUIDE ON SCIENTIFIC EVIDENCE*, *supra*, at 178, 192 (“However, it is possible with a large data set to find statistically significant coefficients that are practically insignificant.”).

46. *See* Sander, *supra* note 2, at 444 tbl.6.1. The flaws in Sander’s Table 6.1 are important both because the problems in it are common to many of his logistic regression models and because Sander regards the inferences he draws from Table 6.1 as central to his entire analysis. Indeed, it is fair to say that if Table 6.1 does not stand, his entire analysis of the probable effects of ending affirmative action falls with it.

time. If one applies Sander's model, which takes account of factors like law school grades and LSAT scores, the total number of correct predictions increases by 29 cases, so that 95.1% of all cases are predicted correctly.<sup>47</sup> In such a large data set that miniscule improvement is significant at the .001 level, but Sander is not justified in characterizing Table 6.1 as a "robust test" of the notion that "race seems irrelevant"<sup>48</sup> on the bar exam, and his implication that it gives us a good idea of what distinguishes bar passers from those who never pass is wrong.<sup>49</sup> We know little more about who passes and who fails the bar exam than the fact that most law school graduates pass, which we knew before we ran the regression.

In addition, Table 6.1 and the tables that present the results from Sander's other logistic regressions raise concerns about Sander's choice of diagnostic statistics, that is, statistics which test the strength of the associations reported in the models and how well they fit the data. One statistic frequently used for this purpose, but not included in *Systemic Analysis*, is the Nagelkerke R-Square.<sup>50</sup> In Sander's Table 6.1, this figure is about .325,<sup>51</sup> which, had it been reported, would have alerted the knowledgeable reader to the likelihood that Table 6.1 leaves much of what leads to bar passage unexplained.

Perhaps the most intuitively understandable information that Sander might have provided is information about how well his model does in identifying those who pass and fail the bar. His model generates for each graduate a predicted probability of passing the bar based on the graduate's scores on the independent variables and the overall likelihood that a person in the sample will pass the bar. One can thus distinguish between graduates who are predicted to have a 50% or better chance of passing the bar and those who are

47. Under a model that separately analyzes Native Americans, we find an improvement of 31 cases (95.2%).

48. Sander, *supra* note 2, at 445 & n.212.

49. Kaye & Freedman, *supra* note 45, at 380-81 ("When practical significance is lacking—when the size of a disparity or correlation is negligible—there is no reason to worry about statistical significance.").

50. N.J.D. Nagelkerke, *A Note on a General Definition of the Coefficient of Determination*, 78 BIOMETRIKA 691 (1991); see also Kenneth N. Klee, *One Size Fits Some: Single Asset Real Estate Bankruptcy Cases*, 87 CORNELL L. REV. 1285, 1327 & n.154 (2002) (summarizing  $R^2$ , Cox and Snell's  $R^2$ , Nagelkerke's  $R^2$ , etc.); G. David Garson, *Logistic Regression*, at <http://www2.chass.ncsu.edu/garson/pa765/logistic.htm> (last visited Mar. 1, 2005) ("[Nagelkerke's  $R^2$ ] is part of SPSS output and is the most-reported of the R-squared estimates.").

51. The Nagelkerke  $R^2$  is not a true  $R^2$  statistic, as it is based on likelihood ratios, but it does give one some purchase on how well a logistic model is doing in explaining outcomes. We say "about .325" because we were unable to reproduce Sander's Table 6.1 precisely. Our regression, for example, had about 0.25% more cases in it than Sander reports for his Table 6.1. We do not believe the differences are important, since the Wald statistics our model yielded were very close to those that Sander reports and the significance levels for the variables in the model were about the same.

predicted to have a less than 50% chance of passing and compare these predictions to actual outcomes. Our replication of Sander's analysis indicates that his model, using the .5 cut-point, is highly accurate in predicting who passed the bar, since it incorrectly labels as "fails" only 91 of the 20,399 graduates who passed. It does a dismal job, however, in predicting who will fail, as it correctly labels as "fails" only 129 of the 1074 sample students who actually did fail, for a success rate of only 12%.<sup>52</sup> Thus, the variables included in Table 6.1 do not support Sander's claim that "[i]f we know someone's law school grades, we can make a very good guess about how easily she will pass the bar."<sup>53</sup> In fact, if we just knew law school grades, we would correctly label only 37 of those who failed, or 3.4%, and we would incorrectly guess that 45 of those who passed had failed. In other words, we would have predicted more bar outcomes correctly by predicting that everyone passed than we would have by predicting based on the grades the graduates received in law school.

Rather than present a range of diagnostics that would have suggested the shakiness of its statistical foundations, *Systemic Analysis* presents only the Somers's D statistic when it reports logistic regression results.<sup>54</sup> Moreover, Somers's D is explained in a way that is likely to confuse those unfamiliar with it: "The 'Somers's D' is a measure of the model's effectiveness in predicting outcomes. A model has a Somers's D of zero if it does not improve our ability to predict a typical individual's outcome; it has a value of one if it perfectly predicts every individual's outcome."<sup>55</sup>

On seeing that Table 6.1 had a Somers's D of .763 and baseline accuracy of about 95%, the reader might assume that the table was close to 99% accurate,<sup>56</sup> which would be impressive indeed. However, in light of the diagnostics we've just discussed, the implication that we are dealing with a near-perfect model is implausible. The reason for the apparent contradiction lies in the nature of logistic regression and how the Somers's D statistic is

52. One can use cut-points other than 0.5; for example, one could predict that only those with a 0.75 probability of passing the bar would in fact pass. When one does this the ability to correctly predict failures increases, but the false negative rate—actual passers who are predicted to fail—also rises.

53. Sander, *supra* note 2, at 444.

54. The Somers's D is a standard diagnostic in SAS, but it is not a logistic regression option in some other popular logistic regression packages like SPSS and STATA.

55. Sander, *supra* note 2, at 438; *see also id.* at 438 n.191 ("For example, if 10% of our sample did not complete law school, we could guess any given person's graduation chances with 90% accuracy simply by consistently guessing that each person would graduate. A Somers's D of 0 in a model for predicting whether a person would graduate would thus indicate a model with that same 90% accuracy rate; a Somers's D of 1.00 would indicate a model with 100% accuracy; a Somers's D of 0.645, like the actual model above, would indicate a model with an accuracy of approximately 96.45%.")

56. We reach this number by multiplying the difference between 95% and 100%, or 5%, by .763 and adding the result to 95%. *See supra* note 55.

calculated. The bottom line is that given that about 95% of those who took the bar passed, Somers's D presents a misleading portrait of how the model does.<sup>57</sup> It certainly should not have been the only regression diagnostic presented.

Numerous other statistical problems can be found in Sander's analysis. These include excluding race as a cause of outcomes in models plagued by multicollinearity,<sup>58</sup> neglecting to model selection effects when predicting student performance,<sup>59</sup> and treating law school tier not as a set of nominal

---

57. Somers's D is a function of the number of concordant pairs, the number of discordant pairs, and the number of case types. What this means is that if *A*, who passed the bar, had a calculated probability of passing the bar of 0.95, and *B*, who failed, had a calculated probability of passing of 0.94, the case would be considered concordant and a success for the model. Similarly, if *C* and *D* had bar passage probabilities of .05 and .04, respectively, and student *C* passed the bar while *D* did not, the case would be considered concordant. Knowing the characteristics of *A* and *B* on the independent variables giving rise to these probabilities, however, one would have predicted that both *A* and *B* would have passed the bar and would similarly have predicted that neither *C* nor *D* would have passed. Because the overall bar passage rate was so high, there is a very high initial probability that any given student would pass the bar. Thus, it is likely that both individuals in many of the concordant pairs had estimated bar passage probabilities above 50%, leading to a high Somers's D if the model's variables do distinguish between those who have a greater and lesser chance of passing, while at the same time producing a model that cannot accurately identify as failures most students who in fact failed. What this means is that the variables in Sander's Table 6.1 equation are predictive of the likelihood of bar passage, but that they are not determinative to nearly the extent he suggests.

58. Cf. Kristine S. Knaplund & Richard H. Sander, *The Art and Science of Academic Support*, 45 J. LEGAL EDUC. 157, 218 (1995) (noting, in an appendix on regression, that "[a]ny time a regression includes two independent variables that are themselves closely associated, it is hard for a regression model to sort out which variable is causing what effect"). Sander also acknowledges multicollinearity in footnote 211 of *Systemic Analysis*, but argues it is not a problem. While that argument may be sound as applied to OLS regression where regression coefficients are not distorted, in logistic regression multicollinearity can affect the regression weights as well as their significance levels. Thus, Sander includes in his Table 6.1 law school GPA, LSAT scores, and UGPA along with race. But the first three variables are highly correlated with race as well as with the dependent variable of bar passage. Indeed, the first three variables are better predictors of whether someone is black or white than they are, along with race, gender, and law school tier, of bar passage. Hence it is not surprising that when race is included in this model it has no significant effects. Moreover, since LSAT is validated only as a predictor of LSGPA, and the latter variable is in the model, LSAT arguably has no place in a well-specified model of variables predicting law school graduation.

59. Students are admitted to law schools for reasons the bar passage study measures, like their LSAT scores, and reasons it does not measure, like information from references describing work habits. If one is trying, as Sander is, to explain outcomes that may be affected by both measured and unmeasured variables, and if people are selected for a treatment (e.g., entrance into a law school of a certain quality) in part for reasons the data do not measure, causal conclusions about the effects of the measured variables may be misleading. There are statistical ways to attempt to cope with this problem. Sander does not employ them. For example, Timothy Clydesdale uses Heckman regression methods to correct for sample selection bias in the BPS, see Clydesdale, *supra* note 6, at 717, and Sigal Alon and Marta Tienda use both Heckman methods and propensity score analysis to control

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1873

variables but as an interval scale measure.<sup>60</sup> In sum, the statistical misstatements and modeling errors in *Systemic Analysis* mean that the conclusions appear to have far more evidentiary support than they in fact do.

## 2. Law school performance and graduation

Sander assumes that if affirmative action ended, African American students would attend law schools where they would have the same entry credentials as whites, and forecasts that they would receive the same grades and graduate and pass the bar at the same rates as their white classmates.<sup>61</sup> Thus, his estimate in Table 8.2 that the 2001 law school cohort would have produced 7.9% more African American attorneys without affirmative action derives from simply applying the white graduation rates and bar passage rates in 1991 from the Bar Passage Study (BPS) to the African American students in the same index score ranges (500-520, 520-540, etc.) who entered law school a decade later.

For several reasons, we believe that Sander overestimates the grades that African American students would receive at the schools they would attend if there were no affirmative action, as well as their rates of graduation. First, despite the statistical significance of grades in the graduation model, it appears that gains in African American law school grades attributable to ending affirmative action would have little or no effect on the graduation chances of those African Americans still attending law school.<sup>62</sup> Their chances of graduating would be about what they are today, even if they attended lower-tier law schools and received somewhat better grades because of less stiff competition. Overall, graduation chances might be slightly better for some and slightly worse for others, depending on the school they moved from and the

---

for selection bias in analyzing the mismatch hypothesis at the undergraduate level, see Sigal Alon & Marta Tienda, *Assessing the "Mismatch" Hypothesis: Differentials in College Graduation Rates by Institutional Selectivity*, 78 SOC. EDUC. (forthcoming 2005).

60. Sander acknowledges that including the tier variables as deviations from an omitted tier is the statistically appropriate method of modeling this variable, but he argues that this makes no difference. Sander, *supra* note 2, at 439 n.194. The claim of "no difference" is wrong. Not only is the model's overall performance slightly though not consequentially different, but also, and more importantly, differences in the performance of students in different tiers are obscured. The latter shortcoming hides information relevant to the question of whether African Americans are "mismatched" and to Sander's "four percent" solution. See Part II *infra*.

61. Sander, *supra* note 2, at 429 n.175 ("[T]he data show that if blacks were admitted to law schools through race-neutral selection, they would perform as well as whites."). This is the corollary of Sander's claim that "[i]t is only a slight oversimplification to say that the performance gap in Table 5.1 is a by-product of affirmative action." *Id.* at 429.

62. Cf. Wightman, *supra* note 20, at 35 (noting that while LSAT and UGPA had validity in the admissions process, for the BPS "they are not significant predictors of graduation from law school").

school they moved to.<sup>63</sup> (The likely outcomes on the bar exam are similarly murky, as we will see in the next Part.)

Second, Sander's expectation that African Americans would earn the same grades as their white classmates derives from his assumption that, if affirmative action ended, the entry credentials of African American and white students at any given school would be the same.<sup>64</sup> His assumption is unjustified. Even if law schools adopted strictly "race-neutral" admissions criteria and each school selected all admittees from a common pool of students within the same above-average range of LSAT scores and UGPAs, it would still be the case that, within that range, the African American applicants and admittees would, on average, have lower LSATs and UGPAs than the white applicants and admittees, because that is where African American students fall in the overall national pool of applicants.<sup>65</sup>

Scholars of all persuasions have recognized the likely persistence of credential disparities between African American and white students within selective institutions in a world without affirmative action. William Bowen and Derek Bok, supporters of affirmative action, recognized it,<sup>66</sup> as did Stephan Thernstrom and Abigail Thernstrom, who are critics.<sup>67</sup> So have many others.<sup>68</sup>

---

63. *Cf. id.* at 36 tbl.7 (finding that, of African Americans who would have been admitted based solely on LSAT/UGPA at the schools where they actually enrolled, 80.5% ultimately graduated, in comparison with 77.9% of those who enrolled in law schools where they would not have been admitted where they enrolled based solely on their LSAT/UGPA). If this model overstates the impact of ending affirmative action, as Sander argues, one would expect even greater convergence between African American graduation rates with and without affirmative action.

64. Sander, *supra* note 2, at 474 n.282.

65. CLAUDE S. FISCHER ET AL., *INEQUALITY BY DESIGN: CRACKING THE BELL CURVE MYTH* 46 (1996) ("Race-neutral selection processes pass disparities in the applicant pool through the freshman class. Therefore, we cannot read a gap in test scores as if it reflected an edge that the admission process gives to some students at the expense of others."). For example, for admittees to the UCLA School of Law in 2003, the LSAT 25th percentile was 162 and the 75th percentile was 168. We would expect the typical African American admitted under race-blind admissions to UCLA would be much more likely to have a 162 than a 168 on the LSAT.

66. WILLIAM G. BOWEN & DEREK BOK, *THE SHAPE OF THE RIVER: LONG-TERM CONSEQUENCES OF CONSIDERING RACE IN COLLEGE AND UNIVERSITY ADMISSIONS* 42-43 (1998) (finding at College and Beyond institutions (a consortium of twenty-eight academically selective colleges, including private institutions such as Oberlin, Princeton, and Stanford, and a few large public institutions such as the University of Michigan and Pennsylvania State University) where they had detailed application data, that realistic race-blind simulations only marginally closed the SAT gap between African Americans and whites and that the African Americans who would have been admitted would still have had much lower SAT scores than the whites).

67. Stephan Thernstrom & Abigail Thernstrom, *Reflections on The Shape of the River*, 46 *UCLA L. REV.* 1583, 1628 n.168 (1999) (book review) (treating a three-digit SAT gap between African Americans and whites among Berkeley's 1998 admits (on a 400-1600 scale) as unremarkable).

In the months since the appearance of his article, Sander has acknowledged that a gap in African American-white entry credentials would persist within law schools, but dismisses the disparity as trivial, estimating that post-affirmative action the African American-white credential gap at any given school would average only six points on a thousand-point scale.<sup>69</sup> We were not able to obtain a step-by-step description of how Sander came up with his estimate of only a six-point gap. However, our review of the relevant literature,<sup>70</sup> as well as our look at the BPS,<sup>71</sup> suggests that a gap this small is exceedingly unlikely.<sup>72</sup>

Consider, for example, what happened at several California law schools in the early years after Proposition 209 prohibited taking race into account in admissions, years when even Sander seems willing to concede that the law

68. FISCHER ET AL., *supra* note 65, at 46; Thomas J. Kane, *Misconceptions in the Debate over Affirmative Action in College Admissions*, in CHILLING ADMISSIONS: THE AFFIRMATIVE ACTION CRISIS AND THE SEARCH FOR ALTERNATIVES 17, 19-20 (Gary Orfield & Edward Miller eds., 1998); Goodwin Liu, *The Causation Fallacy: Bakke and the Basic Arithmetic of Selective Admissions*, 100 MICH. L. REV. 1045, 1064 (2002); Claude M. Steele, *Expert Report of Claude M. Steele*, 5 MICH. J. RACE & L. 439, 449 (1999) (containing his expert report from *Gratz v. Bollinger*, 539 U.S. 244 (2003), and *Grutter v. Bollinger*, 539 U.S. 306 (2003)).

69. Sander made these claims at a panel at the Annual Meeting of the Association of American Law Schools in January 2005. *Cf.* Katherine S. Mangan, *Affirmative Action and Military Recruiting Spur Debate at Law-School Meeting*, CHRON. HIGHER EDUC., Jan. 21, 2005, at A19; *see also* Richard H. Sander, *A Reply to Critics*, 57 STAN. L. REV. 1963, 1999-2001 (2005).

70. *See* sources cited *supra* notes 65-68; *see also* William T. Dickens & Thomas J. Kane, *Racial Test Score Differences as Evidence of Reverse Discrimination: Less than Meets the Eye*, 38 INDUS. REL. 331, 347-48 (1999) ("Reasonable values for the correlation of tests with performance and white-black differences in other abilities suggest that test score differences between the average equally qualified black and white could easily be as large as .85 standard deviation.").

71. For instance, we looked at Tier 3 schools in the BPS, since without affirmative action many African American students now at elite schools might find these were the schools that would admit them. Among whites admitted to schools in this tier, 80% had index scores between 1.12 standard deviations below the mean and 0.22 standard deviations above it (the 10th and 90th percentiles). If we look at all whites and African Americans with scores in this range, which we might think of as the normal range of admits, we find that the median African American admittee's index is almost half a standard deviation below the median white admittee's index (whites averaging -0.27, and African Americans averaging -0.75). These within-tier differences are likely to be attenuated at particular law schools, but they are still likely to be considerable within schools and overlap substantially across same-tier schools.

72. One may find similar claims about the implications of ending affirmative action for the African American-white credential gap in RICHARD J. HERRNSTEIN & CHARLES MURRAY, *THE BELL CURVE* 451-55 (1994), and Gail L. Heriot & Christopher T. Wonnell, *Standardized Tests Under the Magnifying Glass: A Defense of the LSAT Against Recent Charges of Bias*, 7 TEX. REV. L. & POL. 467, 476-77 (2003), but in each case the claim is based entirely on speculation with no evidence.

schools were rigorously complying with Proposition 209.<sup>73</sup> In 1997-1999, the African American students who were admitted to the law schools at Berkeley, UCLA, and UC Davis had test scores and grades within the same range as the white admittees but, as a group, the African American admittees had LSAT scores five to seven points lower than whites on a scale with a sixty-point range, as well as lower UGPAs.<sup>74</sup> Admissions credentials differences that large translate to an African American-white gap of about seventy-five points on Sander's thousand-point scale.<sup>75</sup> At many law schools, a gap this large among whites would translate into a standard deviation or more.<sup>76</sup> Similar gaps between the credentials of entering African Americans and whites persisted among undergraduates at UC Berkeley in the years immediately after Proposition 209<sup>77</sup> and at the University of Texas at Austin in the year following the *Hopwood* decision,<sup>78</sup> as well as among students at the University

---

73. Sander, *supra* note 2, at 418 n.141; Richard H. Sander, *Experimenting with Class-Based Affirmative Action*, 47 J. LEGAL EDUC. 472 (1997); Richard Sander, *Colleges Will Just Disguise Racial Quotas*, L.A. TIMES, June 30, 2003, at B11. Sander believes that cheating by admissions staffs has gone on more recently, but even without cheating, a gap in admissions credentials is certain to continue.

74. This claim is based on data contained on various pages located at Ellen Cook, University of California Admissions, at [http://home.sandiego.edu/~e\\_cook/](http://home.sandiego.edu/~e_cook/) (last visited Mar. 15, 2005).

75. Admittedly, the gap on the LSAT among *matriculants* (data that we could not obtain for this Response) would be smaller in absolute terms given that the top admittees to UC law schools frequently enroll at more elite schools like Stanford. On the other hand, the relative size of the test score gap among matriculants at a school like UCLA is also shaped by the fact that the LSAT standard deviation is smaller among matriculants than admits for the same reason.

76. Sander, *supra* note 2, at 416 tbl.3.2. (reporting that at four of the six tiers of law schools, the standard deviation in the index for whites was between seventy-three and seventy-five).

77. Proposition 209 shrank the African American admissions rate from nearly 50% in 1997 to 20% in 1998, but for the 333 matriculating African American freshmen in 1998-2000 who were not recruited athletes, the 75th percentile score on the SAT was 57 to 90 points lower each year than the 25th percentile score for Berkeley's white freshmen. We derive this claim from data provided in January 2005 by the UC Berkeley Office of the Assistant Vice Chancellor—Admissions and Enrollment Unit. E-mail from Sam Agronow, Former UC Berkeley Director of Policy, Planning and Analysis in the Office of the Assistant Vice Chancellor—Admissions and Enrollment Unit, to William Kidder, Equal Justice Society (Jan. 25, 2005) (on file with author). Note that this was before UC adopted the 4% plan and “comprehensive review.” (The 4% plan makes eligible for admission to the UC system any in-state student who takes the requisite courses and graduates in the top 4% of her high school class. “Comprehensive review” is designed to deepen the definition of merit by evaluating students holistically on several academic and nonacademic criteria.)

78. GARY M. LAVERGNE & BRUCE WALKER, IMPLEMENTATION AND RESULTS OF THE TEXAS AUTOMATIC ADMISSIONS LAW (HB 588) AT THE UNIVERSITY OF TEXAS AT AUSTIN 15 tbl.7(b) (2003), available at <http://www.utexas.edu/student/admissions/research/HB588-Report6-part1.pdf> (reporting a mean African American-white gap among 1997 UT-Austin freshmen of 156 points on the SAT (the African American n here is 185)). 1997 was the year

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1877

of California medical schools.<sup>79</sup> Thus, if Sander's claim is correct that "one hundred persons with an LSAT score of 161 are highly likely to have higher law school grades and higher pass rates on the bar than one hundred persons with an LSAT of 160,"<sup>80</sup> then the presence of continuing African American-white disparities among same-school matriculants renders untenable his claim that, post-affirmative action, African Americans would do as well as their white classmates.

Third, *Systemic Analysis* is wrong for yet another reason in concluding that, within schools, African American students would perform as well as whites absent affirmative action. As studies conducted by the LSAC have shown more than once, even among white and African American students with identical entry credentials, African American students typically receive somewhat lower law school grades than whites.<sup>81</sup>

Sander's claim to the contrary rests entirely on his analysis of a data set he assembled in 1995 that included grades for the first semester of the first year at twenty law schools. He calls this data set the National Survey of Law School Performance (NSLSP).<sup>82</sup> He uses this data set rather than the BPS data set that he relies on for his other tables of law school and bar performance because he believes that it offers certain statistical advantages. If he had used the BPS, he would have reached quite different conclusions, conclusions that would have been more consistent with almost all the research that has been done relating standardized test scores among African Americans to later graded performance. In another article, one of us, Timothy Clydesdale, used the BPS to analyze law school grades and found that after controlling for LSAT scores and undergraduate grades, being African American remained negatively related to

---

prior to Texas's enactment of legislation requiring UT-Austin and other Texas public universities to admit all high school seniors within the state who were in the top 10% of their class.

79. The hundreds of African Americans and Latinos offered admission to the five UC medical schools in 1997-1999 had UGPAs which were over one-quarter of a grade point lower than white/Asian American admittees; there were also substantial MCAT differences. On this point, see the various websites contained at Cook, *supra* note 74.

80. Sander, *supra* note 2, at 423 n.159. Needless to say, we believe the credential gap would be much larger than one point on the LSAT, which is why this is a significant issue even though we believe Sander overstates the connection between index scores and bar passage.

81. See, e.g., LISA C. ANTHONY & MEI LIU, LAW SCH. ADMISSION COUNCIL, ANALYSIS OF DIFFERENTIAL PREDICTION OF LAW SCHOOL PERFORMANCE BY RACIAL/ETHNIC SUBGROUPS BASED ON THE 1996-1998 ENTERING LAW SCHOOL CLASSES, at 10 fig.4c (2003). Note that there is considerable variation across schools in Figure 4c, including underprediction at a dozen schools. *Id.*

82. Kris Knaplund, Kit Winter & Richard Sander, 1995 National Survey of Law Student Performance CD-ROM [hereinafter NSLSP].

performance.<sup>83</sup> Moreover, he found that African American students were not alone in this regard: Latinos, Asian Americans, and law students over thirty also underperformed.<sup>84</sup>

Sander's reasons for not using the BPS have some force but are not fully persuasive.<sup>85</sup> Moreover, the weaknesses of the BPS do not alter the fact that Sander's decision to analyze the NSLSP, and the model he uses to analyze it, raise serious problems of their own. As an initial matter, the NSLSP contains information only on grades in the first semester of law school.<sup>86</sup> Sander offers no evidence that first-semester grades are a reliable indicator of performance during the rest of law school.<sup>87</sup> Even more troubling, in performing his analysis of the NSLSP, Sander handled students' race in a puzzling and distorting manner. The NSLSP has an abnormally high rate of missing data about race, with 24.6% (1176 of 4774) of respondents failing to indicate their race. (By

---

83. In an OLS regression on first-year grades of 24,998 students in the BPS, using LSAT, UGPA, racial groups, and law school tiers as controls, being African American (as opposed to white) has an unstandardized coefficient of -0.687 ( $p < .001$ ). Clydesdale, *supra* note 6, at 754.

84. *Id.*; see also ANTHONY & LIU, *supra* note 81, at 12 fig.5c, 13 fig.6c.

85. Sander rejected the BPS because it did not standardize the students' LSAT scores and undergraduate grades according to the law school they attended. Without standardization, he believes that regression results on law school performance would "be meaningless at best and highly misleading at worst." Sander, *supra* note 2, at 428 n.172. There is substance to his concern. Clydesdale sought to deal with the standardization problem by controlling for law school tier. This control should help because law schools tend to be homogenous within tiers (and different across tiers) on admissions credentials. Indeed, credential homogeneity was a factor Wightman used to sort schools into tiers. Sander himself describes the standard deviation among whites and among African Americans in first-tier schools as "strikingly small." *Id.* at 415. They are similarly small at most of the other tiers. See *id.* at 416 tbl.3.2. Still, we cannot be confident how well the tier control does its job. Anthony and Liu's study, see *supra* note 81, does not have this problem, however, and its consistency with Clydesdale's findings is good reason to accept the latter's conclusions on this issue.

86. Sander's Table 5.2 is mislabeled as predicting "First-Year Law School Grades." *Id.* at 428. The data set actually consists only of first-semester grades. *Id.* at 421. On the page before Table 5.2 is Table 5.1, which is based on the BPS and is also labeled as representing "First-Year GPAs." This table actually does report grades for the full first year.

87. Jamie Muskovan, a research assistant at the University of Michigan, studied for us the grades of a random selection of white students and of all African American students in the two most recent classes at the University of Michigan Law School for which grades were available. She found that, among African American students, the grades they received during their first semester explained only 27% of the variance in the grades they received in their third year ( $R = .520$ ). Although these results are from one school only, they may explain why all the factors in Sander's model account for only 19% of variance (Table 5.2), when LSAC studies of ABA law schools covering the same period, which include only data on LSAT and unadjusted UGPA, explain 25% of variance in law school grades for the full first year. LISA C. ANTHONY ET AL., LAW SCH. ADMISSION COUNCIL, PREDICTIVE VALIDITY OF THE LSAT: A NATIONAL SUMMARY OF THE 1995-1996 CORRELATION STUDIES 6 tbl.2 (1999); Wightman, *supra* note 20, at 31-34.

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1879

contrast, in the same year just 0.6% (272) of the 42,151 first-year matriculants at ABA law schools failed to report their race/ethnicity to the LSAC.<sup>88</sup>) Sander compounded this missing data problem by lumping those who did not report their race with the white respondents, assuming that those who did not reveal their race were probably white.<sup>89</sup> Such an assumption might be plausible in other contexts, but not for the NSLSP, which contains easy-to-spot evidence strongly suggesting that a large proportion of those who failed to report their race were not white.<sup>90</sup> Table 2 displays three ways Sander might have handled the missing data group in his analysis: the way that he actually handled it and two methodologically more appropriate (though not perfect) ways, one excluding the nonrespondents and the other treating them as a separate category. Under either alternative, being African American is significantly and negatively associated with law school grades. Ultimately, the likely difference in grades between whites and African Americans with identical credentials would be modest but not trivial, with African Americans ending up about 5% or 6% lower in class rank than white students with the same credentials. The predicted differences between the groups might well have been greater if all NSLSP students had actually answered the question about race. Accordingly, in the analysis of the NSLSP, race appears irrelevant only when the data are mishandled.<sup>91</sup>

---

88. LAW SCH. ADMISSION COUNCIL, *MINORITY DATABOOK* 28 tbl.V-3 (Kent D. Lollis ed., 2002). An additional 2.7% classified themselves as "other." *Id.*

89. Sander states that, as far as he can determine, "students not reporting race were predominantly white or Asian, which supports the approach taken in this table." Sander, *supra* note 2, at 430 n.175.

90. Within the NSLSP, the LSATs, UGPAs, and law school grades of those declining to state their racial/ethnic group are midway between the African American and white averages. In addition, 16% of the NSLSP respondents who failed to identify their race reported elsewhere on the survey experiencing "substantial hostility along racial lines," compared to 8% of respondents identifying themselves as white, 19% of those identifying themselves as Hispanic, and 31% of those identifying themselves as African American. Thus, we think it is almost certain that those who did not respond to the race inquiry included a substantial proportion of nonwhites. It is no wonder that when this group is lumped together with the whites, white performance does not appear that different from minority performance. As Sander admits in his article, he was made aware of the problem with lumping race nonrespondents with whites prior to the publication of his article. *Id.* at 430 n.175 (noting Jim Lindgren's remarks to this effect). He nonetheless left Table 5.2 as it was.

91. Also consistent with Clydesdale's analysis of the BPS, it is not just African American students in the NSLSP who tend to receive lower grades than whites when controlling for admissions credentials. This appears true of all ethnic groups, though the significance levels for Asians are marginal, possibly because of smaller sample size.

Model N	4,257		4,257		3,231	
Adjusted R-Square	.190		.199		.175	

Source and Notes: The data here are from NSLSP, *supra* note 82. "Other (Reported) Race" includes responses of Native American, Pacific Islander, multiracial, or "other" race. The "†" symbol denotes that  $p < .1$ ; the "\*" symbol, that  $p < .05$ ; the "\*\*\*" symbol, that  $p < .01$ ; the "\*\*\*\*" symbol, that  $p < .001$ .

Our analyses of both the NSLSP and BPS thus reveal that Sander is wrong when he concludes that the current lower performance by African Americans in law school is "a simple and direct consequence of the disparity in entering credentials between blacks and whites."<sup>92</sup> It is not. Exactly why African Americans perform somewhat less well in law school than their credentials would predict remains unclear. It may be due in part to statistical artifacts,<sup>93</sup> but it could also reflect a variety of phenomena related to the experiences of African American students during law school.<sup>94</sup> Sander rejects the possibility

92. *Id.* at 427.

93. *See, e.g.*, Robert L. Linn & C. Nicholas Hastings, *Group Differentiated Prediction*, 8 APPLIED PSYCHOL. MEASUREMENT 165 (1984).

94. *See* Clydesdale, *supra* note 6, at 758-61. Law school atmosphere effects are also suggested by Anthony and Liu's identification of a subset of schools where African American students perform as well as or better than their credentials predict. ANTHONY & LIU, *supra* note 81, at 10 fig.4c. Moreover, in a study coauthored by Sander of 1100 third-year law students at eleven law schools, the authors found that "[w]omen, blacks, and Asians are disproportionately represented among the alienated students." Mitu Gulati et al., *The Happy Charade: An Empirical Examination of the Third Year of Law School*, 51 J. LEGAL EDUC. 235, 255 (2001). A possibility that we cannot test empirically is whether the ending of affirmative action itself would cause a worsened campus climate that might translate into lower rates of law school completion for African Americans. The post-Proposition 209

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1881

that stereotype threat and test anxiety contribute to the lower grades African Americans receive.<sup>95</sup> He justifies this rejection by pointing, repeatedly, to a finding from the NSLSP that the gap between the grades of African American and white law students is as large in first-year writing courses, where students have plenty of time for their assignments, as it is in more traditional first-year courses with timed exams.<sup>96</sup> It turns out, however, that NSLSP data are of little value for making this claim. The NSLSP sample included only 59 African American students with grades in first-semester writing courses, and 46 of them attended a single law school where the black students may have had particularly poor writing skills.<sup>97</sup>

Sander concludes his section on law school performance with a discussion of graduation rates. The BPS reports that 19.2% of African American students and 8.2% of white students who started law school in 1991 failed to complete law school within six years.<sup>98</sup> Sander finds that within the BPS, first-year law school grades are by far the best predictor of who graduates and that being African American is unrelated to graduation. However, as we explained in Part I.A, Sander's conclusion reaches far beyond what is supported by his data, and even if African American students' grades improved somewhat, the rate of graduation might change very little.<sup>99</sup> Although first-year law school grades are

---

climate issue was raised by students of color at UCLA and other UC law schools in *Grutter. See Testimony of Chrystal Blossom James*, 12 LA RAZA L.J. 433, 438 (2001) (excerpting testimony James provided in *Grutter v. Bollinger*, 137 F. Supp. 2d 821 (E.D. Mich. 2001)); Brief of Amici Curiae UCLA School of Law Students of Color in Support of Respondent, *Grutter v. Bollinger*, 539 U.S. 982 (2003) (No. 02-241), available at [http://www.umich.edu/~urel/admissions/legal/gru\\_amicus-ussc/um/UCLA-gru.doc](http://www.umich.edu/~urel/admissions/legal/gru_amicus-ussc/um/UCLA-gru.doc); cf. Cecil J. Hunt, II, *Guests in Another's House: An Analysis of Racially Disparate Bar Performance*, 23 FLA. ST. L. REV. 721, 774 (1996).

95. Sander, *supra* note 2, at 427. For a summary of the research literature on stereotype threat, see for example, Claude M. Steele et al., *Contending with Group Image: The Psychology of Stereotype Threat and Social Identity Theory*, 34 ADVANCES EXPERIMENTAL SOC. PSYCHOL. 379 (2002).

96. Sander, *supra* note 2, at 373, 424, 427, 435 n.182.

97. Of the twenty schools in the NSLSP, this school has by far the lowest standing in the *U.S. News* rankings of law schools. In a footnote, Sander acknowledges the need for more research and that his legal writing sample is "small." *Id.* at 434 n.182.

Sander's attempted refutation also fails because totally apart from the small and biased sample of NSLSP students with first-term writing course grades, stereotype threat and test anxiety do not necessarily disappear as causes of poor performance simply because there is little or no time pressure on an assignment. See Ian Ayres & Richard Brooks, *Does Affirmative Action Reduce the Number of Black Lawyers?*, 57 STAN. L. REV. 1807, 1840 (2005).

98. Sander, *supra* note 2, at 436.

99. We essentially reproduced Sander's results, with coefficient significance levels and the relative importance of the independent variables being close to the same (e.g., the Wald statistic for law school GPA (LSGPA) in our model is 1460.75; in Sander's it is 1452.36, see Sander, *supra* note 2, at 439 tbl.5.6). Looking at diagnostics that Sander does not present, we found a Nagelkerke  $R^2$  of .261. While the model is almost perfect (99.7% accurate) in

1882

STANFORD LAW REVIEW

[Vol. 57:1855]

the most important predictor of graduation among the variables in the model, even if we know first-year grades and all the other information in the model, there is still much we do not know about the causes of failure to finish law school.

### 3. *Performance on the bar examination*

The BPS was undertaken by the LSAC to explore whether whites, African Americans, and other racial and ethnic groups passed the bar at similar rates, and, more broadly, to explore what factors account for who does and does not pass the bar.<sup>100</sup> Building on surveys of the entering law school class of 1991, it remains the only substantial national study ever conducted of African American and white bar passage. BPS data indicate that, among students who graduated from law school in 1994 or 1995 and who took a bar examination one or more times before the end of 1996, 3.3% of whites and 22.4% of African Americans never passed the exam. Sander believes that if affirmative action ended, African Americans, no longer mismatched, would perform as well in law school as their white classmates and then graduate and pass the bar at the same rates.<sup>101</sup> He believes that, in this way, about three-fourths of the bar passage gap between whites and African Americans would be eliminated.<sup>102</sup>

---

correctly identifying those who graduate when the criterion for predicting graduation is an estimated probability of graduation that is .5 or more, it does miserably in predicting who will not graduate, as it correctly identifies only 10.8% of those who do not graduate, a result, almost certainly, of a highly skewed data set as well as model deficiencies.

100. Henry Ramsey, Jr., *Historical Introduction* to LINDA F. WIGHTMAN, LSAC NATIONAL LONGITUDINAL BAR PASSAGE STUDY iii, *passim* (1998) [hereinafter WIGHTMAN, BAR PASSAGE STUDY].

101. Sander, *supra* note 2, at 448-54. Sander tries to bolster his case for the mismatch hypothesis by citing others who have studied the issue, chiefly at the undergraduate level. *Id.* at 450-54. But the evidence from other studies is mixed and most are not fully applicable to the situation of American law schools. We address some of Sander's claims about the implications of the literature he cites in our longer Web version of this Response, *see supra* note 11. We do want to note that one article Sander relies on in his reply, Sander, *supra* note 69, at 1972 n.18, Stacy Berg Dale & Alan B. Krueger, *Estimating the Payoff to Attending a More Selective College: An Application of Selection on Observables and Unobservables*, 117 Q.J. ECON. 1491 (2002), has a more nuanced message when read in context. Dale and Krueger found that "the school a student attends is systematically related to his or her subsequent earnings," *id.* at 1518, and that "the returns to school characteristics such as average SAT score or tuition are greatest for students from more disadvantaged backgrounds," *id.* at 1524-25. There were apparently too few African American students in the 1976 College and Beyond sample Dale and Krueger used for them to separate African Americans from whites with respect to disadvantage, but we know from the BPS data that African Americans in law school have significantly more disadvantaged socioeconomic backgrounds than whites. Wightman, *supra* note 20, at 42 n.99 tbl.N7 (50.7% versus 22.3% are lower middle class). For a well-done refutation of the undergraduate mismatch hypothesis, see Alon & Tienda, *supra* note 59.

102. Sander, *supra* note 2, at 474 n.282.

We have already discussed the reasons we believe that Sander, in discussing his analysis of bar passage in Table 6.1 and the mismatch theory he builds from it, greatly overstates the degree to which law school grades and entry credentials actually help distinguish those who pass the bar from those who fail.<sup>103</sup> But ultimately his mismatch theory is unconvincing because it fails to stand up against the data that the BPS itself offers about bar passage by students of similar credentials at different tiers of schools.

A simple prediction flows directly from the mismatch hypothesis: for an African American student with a given index score, the lower the student's tier, the better he or she should do in law school and on the bar. Indeed, it should not matter whether the student has a higher or lower index score than other students in the tier; either way, that student should be advantaged on the bar if Sander is correct in his suppositions, because she should get better grades than she otherwise would and thus be more likely to graduate and pass the bar.<sup>104</sup>

Table 3 displays what we find when we look within the BPS at African American students with similar credentials who attended schools of different tiers. For the table, we computed an admissions index that ranked students as Sander did based on the LSAT score and UGPA of each African American student. We then divided the students into five groups (quintiles) according to their index scores and looked at the bar passage rate among matriculants within each index group across the tiers of schools in the BPS, arranged from left to right by median African American index score. If Sander's hypothesis is sound,

---

103. *See supra* Part I.B.1. That Sander has not sufficiently established a strong connection between index scores and eventual bar outcomes is corroborated in other ways. For example, in Part IV Sander claims that LSAT scores and UGPAs explain "well over 35%" of the variance in bar exam results, which he characterizes as an "impressive" figure. Sander, *supra* note 2, at 421. However, that claim is not accurate as applied to the BPS. Sander cites an unpublished study of the July 2003 California bar exam by Klein and Bolus, who looked at scaled bar scores (a 1460, 1470, etc.), not exam passage or failure, the question that we and Sander are addressing here. Wightman's analysis of the BPS data, the best nationwide data we have, reveals that LSAT and UGPA explain only about 10% of the variance in bar exam pass/fail status. WIGHTMAN, *supra* note 100, at 37-40; Wightman, *supra* note 20, at 38-39. Only by including law school grades in the model—unknown when admission decisions are made—could Wightman explain 35% of variance in bar pass/fail status within the BPS. WIGHTMAN, *supra* note 100, at 39 (finding, for thirty-nine jurisdictions with sufficient data, a .58 correlation between law school GPA/LSAT and bar passage within jurisdictions, and a .52 correlation across jurisdictions).

104. In our longer Web version of this Response, *see supra* note 11, we also present differences in African American-white bar passage rates by law school tier and student index score. This analysis shows that differences between white and African American bar passage rates are substantial among those with similar index scores attending the same tier law school. Contrary to mismatch-hypothesis expectations, whites almost always outperform African Americans in the same index group and tier. Differences between white and African American bar passage rates controlling for tier tend to be smallest in the elite and the second-tier public schools, though according to Sander's data the average mismatch in these tiers is similar to those of all other tiers except the historically black schools.

1884

STANFORD LAW REVIEW

[Vol. 57:1855]

one would expect to find that looking across each row, the percentage of students who passed the bar would increase. Given the same index, students at each successively lower tier should do better on the bar.

TABLE 3: PERCENTAGES OF AFRICAN AMERICAN MATRICULANTS WHO PASSED THE BAR, BY TIER OF SCHOOL ATTENDED AND ADMISSIONS INDEX AMONG AFRICAN AMERICAN MATRICULANTS

	Elite	Prestige	Midrange Public	Midrange Private	Historically Minority	Lowest Tier	Total
<b>Index in Lowest 20%</b>	*	21.4% (3:11)	32.4% (22:46)	42.2% (38:52)	34.4% (43:82)	34.8% (16:30)	35.6% (122:221)
<b>Index in 2nd Lowest 20%</b>	*	48.3% (14:15)	57.9% (55:40)	50.0% (49:49)	58.9% (42:30)	32.0% (8:17)	53.1% (171:151)
<b>Index in Middle 20%</b>	75.0% (12:4)	54.0% (27:23)	64.8% (81:44)	46.9% (46:52)	70.7% (41:17)	50.0% (6:6)	59.3% (213:146)
<b>Index in 2nd Highest 20%</b>	92.0% (23:2)	67.2% (41:20)	76.7% (99:30)	65.9% (58:30)	75.8% (25:8)	*	72.7% (250:94)
<b>Index in Highest 20%</b>	90.3% (84:9)	85.9% (85:14)	81.7% (67:15)	86.6% (39:6)	85.7% (18:3)	*	86.4% (299:47)

Source and Notes: Data are from WIGHTMAN, BAR PASSAGE STUDY, *supra* note 100. Ratios in parentheses are each n = eventual known pass to n = known fail plus nongraduating black matriculants. Black law school graduates with unknown bar exam results are excluded. The “\*” symbol indicates there were fewer than ten cases.

When we examine Table 3, however, what we see are some relationships that are consistent with the mismatch hypothesis and about as many that are inconsistent.<sup>105</sup> This mix of results does not mean that we can say the mismatch hypothesis is partially proven. Rather, it calls the mismatch hypothesis into question.<sup>106</sup>

105. In our longer Web version of this Response, *see supra* note 11, we also use regression analysis to look at the effects of tier placement on performance for students with similar index scores. This has the advantage of treating the index score as a continuous rather than a discrete variable. The results ran strongly counter to mismatch-hypothesis predictions. We have chosen to use a tabular presentation here because we think most readers will find the results easier to understand.

106. Absent some sound theoretical basis for conditioning the mismatch hypothesis so that it can be expected to apply only in some and not other comparisons, the inconsistent pattern of relationships seen in Table 3 suggests no systematic effects are associated with the degree of mismatch. As this finding stands up in other analyses, *see Ayres & Brooks, supra* note 97; Daniel E. Ho, Comment, *Why Affirmative Action Does Not Cause Black Students to*

There are nonetheless some intriguing patterns in Table 3. Look first at those African American law students who attended elite law schools. Almost none of these students were in the two lowest quintiles of the African American admissions index across all schools,<sup>107</sup> but those in the other three quintiles, contrary to the mismatch theory, passed the bar at higher rates than similarly credentialed black students in all other tiers. Now look at the other extreme, students in the lowest-tier schools, which attract few black students in the top two quintiles.<sup>108</sup> In nearly all cases, African American students in these schools do worse or no better than students in the same index quintiles at higher-ranking law schools. Thus, in neither the most elite schools nor the least elite schools does the mismatch theory find support.

Table 3 offers other interesting comparisons but no consistent message. Perhaps most striking is the performance of students at historically black schools. If index credentials are held constant, these students perform on the bar about as well as or better than African American students in all other tiers except the elite tier. If we didn't have the data on the lowest-tier law schools, we might suppose we had evidence here for the mismatch hypothesis.<sup>109</sup> But it seems far more likely that the performance of students in the historically black law schools supports a different hypothesis: namely, that there is something about cultural understandings in or the educational atmosphere surrounding most predominantly white law schools that keeps many black students from reaching their full potential.<sup>110</sup> Why this occurs is beyond the scope of this

---

*Fail the Bar*, 114 YALE L.J. (forthcoming 2005) (on file with author), it means that at least with respect to the 1991 BPS data, the mismatch hypothesis should be rejected.

107. In fact, at the elite schools, there were only two African Americans in the bottom two quintiles. Both passed the bar.

108. There were a combined total of only ten African American students at the third-tier schools with indices in the top two quintiles. Six of them passed the bar.

109. Even if there were substance to the mismatch hypothesis and attending a historically black school avoided mismatches, it wouldn't help much in producing new African American attorneys since those displaced by the cascaders down would in large part be African Americans.

110. Henry Braddock II & William T. Trent, *Correlates of Academic Performance Among Black Graduate and Professional Students*, in COLLEGE IN BLACK AND WHITE: AFRICAN AMERICAN STUDENTS IN PREDOMINANTLY WHITE AND IN HISTORICALLY BLACK PUBLIC UNIVERSITIES 161, 173 (Walter R. Allen et al. eds., 1991) ("For Black professional students, grade performance is explained by a more diverse set of factors including social background factors such as sex and age, major-field competitiveness, interaction with white faculty, and the presence and role of Black faculty in the students' programs."). A parallel phenomenon appears at the undergraduate level. See, e.g., Walter R. Allen, *The Color of Success: African-American College Student Outcomes at Predominantly White and Historically Black Public Colleges and Universities*, 62 HARV. EDUC. REV. 26, 41 (1992) ("Finally, little doubt exists over the negative impact of hostile racial and social relationships on Black student achievement.").

Response, but stereotype threat, financial circumstances, and the scarcity of African American faculty may play a role.<sup>111</sup>

It is, of course, possible that students in higher-tier schools are more able than students with the same index scores in lower-tier schools in ways that index scores alone do not capture. For example, the component of the index based on undergraduate grades does not take into account the difficulty of the applicant's undergraduate major or the overall quality of the student body at the college she attended. Thus, students selected by higher-tier schools might generally have attended more demanding colleges and taken more challenging courses than students with similar index scores accepted only at lower-tier schools. On this ground, Sander has argued that our finding that higher-tier students in the BPS pass the bar at higher rates than students with the same index scores from lower-tier schools is not necessarily inconsistent with his mismatch theory.<sup>112</sup> After all, the higher-tier students might have passed the bar at even higher rates if they had attended lower-tier schools. We believe that this selection bias argument deserves consideration, despite the fact that Sander's own central thesis—that lower African American law school (and bar) performance is “simply a function” of lower LSATs and UGPAs—leaves no room for it.<sup>113</sup>

---

111. For more on stereotype threat and cites to relevant literature, see Steele et al., *supra* note 95. A second hypothesis is that financial circumstances lead to higher dropout rates (and hence failure to pass the bar) at more elite schools since the predominantly minority law schools have the least expensive tuition of any tier. Wightman, *supra* note 13, at 246 n.28. A third hypothesis is that the interaction at historically black law schools with many black faculty members is a positive factor. See Elizabeth Mertz et al., *What Difference Does Difference Make? The Challenge for Legal Education*, 48 J. LEGAL EDUC. 1, 74 (1998) (finding, in a systematic observational study of classrooms in eight law schools for an entire semester, that “[t]he most striking [pattern] is the connection between the presence of a teacher of color and greater participation by students of color”).

112. These remarks were made by Sander at a panel discussion of his work at the annual meeting of the Association of American Law Schools on January 8, 2005, in San Francisco, CA, and in a talk at the University of Michigan Law School on January 24, 2005. Sander cites undergraduate school as an unmeasured variable that can influence law school admission, and it is plausible to think that it also influences law school success. But several LSAC validity studies show that adjusting UGPA based on a ranking of quality of the undergraduate institution does not consistently improve the prediction of law school grades above that achieved using the combination of students' LSATs and unadjusted UGPAs. See, e.g., Donald A. Rock & Franklin R. Evans, *The Effectiveness of Several Grade Adjustment Methods for Predicting Law School Performance*, in 4 LAW SCH. ADMISSION COUNCIL, REPORTS OF LSAC SPONSORED RESEARCH 363, 444 (1984) (arguing “against the use of these types of grade adjustment techniques” in part because of “relatively modest and unstable validity gains”).

113. According to the argument of Sander's article, unmeasured variables have very little to do with which African American applicants a law school decides to admit and virtually nothing to do with the success of African American students after admission. In these circumstances, there would be almost no room for missing information to bias our findings. Sander, *supra* note 2, at 429; see also calculations underlying tbl.8.2, at 475-77.

While selection bias *might* mean that students at Tier 1 law schools would have done even better if they had attended Tier 3 law schools, the mere fact that something is possible does not mean it is likely, and in this case the evidence is to the contrary. A recent paper by Daniel E. Ho responding to *Systemic Analysis* has examined the selection bias issue exhaustively and found that the combination of self and school selection may indeed explain why the African American students in one tier do better than similarly credentialed African American students in another tier, but the data also indicate that African American student success would not be improved by matriculation at less competitive law schools.<sup>114</sup> These findings suggest that if students in Tier 1 schools do better than similarly credentialed students in less selective tiers, then admissions officers at the Tier 1 schools are doing their job well and are able to identify students whose chances of graduating and passing the bar are not just good, but better than those of other African American students with similar quantitative credentials.

In another article in this issue, Ian Ayres and Richard Brooks identify a second way to test the mismatch theory that uses the BPS data set and that largely (though not entirely) avoids the problem of selection bias.<sup>115</sup> We find the Ayres-Brooks analysis on this point compelling.<sup>116</sup> Here we provide a very brief summary of their findings. Within the BPS data set, they identify a substantial group of African American students, all of whom had been admitted to two or more schools, one of which was their “first choice.” They then divide this group into two subgroups and compare the law school grades and bar passage rates of the students who elected to attend their first-choice school with those of the students who attended their second- or third-choice schools. Ayres and Brooks reason that, if the mismatch theory were sound, the students who elected to attend their second-choice schools ought to perform better in law school and on the bar than those who went to their first-choice school. Their approach largely controls for selection bias because the students attending their second-choice schools had been attractive enough as applicants that they could

---

We think, however, that Sander was correct in his Web reply, and not in his Article, that selection by law schools based on unmeasured variables that also correlate with success occurs and should be taken into account in building causal models of graduation and bar passage. See Richard H. Sander, *Polemics Without Data* 18-19, <http://www1.law.ucla.edu/~sander/Data%20and%20Procedures/StanfordArt.htm> (Jan. 14, 2005) (draft). However, we, unlike Sander, are not attempting causal modeling. Rather, we are presenting a portrait of what happens, or happened with the 1991 cohort, under affirmative action. What happened is consistent with the claims of elite school admissions officers that in admitting minority students they look beyond test scores to other factors that predict whether an applicant can meet their school’s academic expectations.

114. Ho, *supra* note 106.

115. Ayres & Brooks, *supra* note 97, at 1827-1838.

116. After reading their response in draft form, we performed our own analysis of the data and reached the same results.

1888

STANFORD LAW REVIEW

[Vol. 57:1855]

have matriculated at a more elite school. Ayres and Brooks find that students who attended their second-choice school neither received better final law school grades nor passed the bar at higher rates (after possible multiple attempts) than those who went to their first-choice school,<sup>117</sup> and conclude that, for African American students, the BPS does not support Sander's mismatch theory.

*C. The Bottom Line: The Net Effects on the Numbers of African American Lawyers*

In Table 8.2 of his article, Sander makes an overall forecast about the effects of ending affirmative action. He concludes that, despite a decline of 14.1% in the numbers of African American students admitted to law school, there would have been a net increase of 7.9% in the numbers of African American attorneys entering the bar in 2001. In Table 4, we have done our own calculations of the same steps in Table 8.2 and arrive at quite different estimates.

TABLE 4: CONTRASTING ESTIMATES OF THE EFFECTS OF ELIMINATING AFFIRMATIVE ACTION ON THE PRODUCTION OF AFRICAN AMERICAN ATTORNEYS

Stage of the Process	Sander's Estimates (Using Data from 1991 and 2001)	Our Rough Estimates (Using Data from 1991 and 2004)
Applicants	Unchanged	-15% to -25%
Admittees	-14.1%	-40% to -50%
Matriculants	-14.1%	-40% to -50%
Graduates	-8.1%	-35% to -45%
Passing the Bar	+7.9%	-30% to -40%

Sources: For Sander's estimates, see Sander, *supra* note 2, at 473 tbl.8.2. Our estimates are projections based on WIGHTMAN, BAR PASSAGE STUDY, *supra* note 100, and LAW SCH. ADMISSION COUNCIL, *supra* note 16.

How did Sander and we arrive at such different numbers? As to applications, Sander assumes that, without affirmative action, all those who applied before would apply again (including those whose credentials were so low that they would no longer have any hope of being admitted anywhere). We believe that applications would decline, both from those who recognize that with race-neutral criteria they will be accepted nowhere and from those who could still get in somewhere, but who, for the reasons we spell out in Part I.A.2

117. Ayres & Brooks, *supra* note 97, at 1838.

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1889

above, would decide that they do not want to attend or cannot afford to attend the sorts of schools that might admit them.<sup>118</sup> We estimate that the total decline in applications would be around 15% to 25%.

As to admissions, Sander estimates a decline of 14.1%, adopting Linda Wightman's estimation, using the grid model with 2001 data, of the proportion of African American students who would not be admitted to any of the country's ABA-approved law schools. To reach our estimate, we applied Wightman's grid method to more recent 2004 admissions information and, as we report in Part I.A.1, found that, because of a large increase in white applicants, 32.5% of African American students would not have been admitted anywhere in that year, even if they had applied to a wide range of schools. Our ultimate estimate of a decline of 40% to 50% in the number of admittees includes both the drop in the number of admissible students and our earlier estimate of those who could still get in somewhere but would no longer choose to apply.

Sander's remaining estimates are not only biased by the cohort he examined but also affected by an error in his treatment of the 14.1% of students he assumed could not get into any law school. Sander misapplied Wightman's results when he based his estimates of the proportion of African American students who would graduate and pass the bar by removing *the entire* bottom 14.1% of African Americans by index scores from the 1991 sample and keeping *all* of those with higher index scores.<sup>119</sup> In doing so, he did not realize or take into account the fact that Wightman's model indicates that some African American applicants with very low index scores would get into some law school if they succeeded at the same rate as similarly credentialed whites, and some with higher index scores would have been excluded. The result of Sander's oversight is that he mistakenly eliminates 366 African American admittees with index scores under 500, and mistakenly retains 339 African American admittees with 500-700 index scores and 27 with 700+ index scores.<sup>120</sup> Accepting all of Sander's other methods, this one error on Sander's

---

118. Ironically, it is conceivable that ending affirmative action could have the smallest effect on the number of applications by African Americans in the lowest index score ranges. In 2004, market signals did not stop 1384 African Americans with 120-134 LSATs from applying to law school, even though only 15 (1%) were admitted. Underrepresented minorities from disadvantaged backgrounds tend to have less access to good information about higher education. Grace Kao & Marta Tienda, *Educational Aspirations of Minority Youth*, 106 AM. J. EDUC. 349 (1998). There are also cyclical barriers in the information market, including the fact that many students send in their applications a month or more before they receive their LSAT scores.

119. *But see* Wightman, *supra* note 13, at 242 tbl.6. Within each of ninety LSAT/UGPA cells, Wightman's grid model applies the white admission rate to the African American applicants in the same cells.

120. This claim is based on the authors' grid model calculations using LAW SCH. ADMISSION COUNCIL, *supra* note 16, which produced a 14.3% decline in African American

part inflates the African American 2001 post-affirmative action bar passage rate (as a percentage of entering law students) by about 2.7 percentage points. Thus, recalculating Sander's Table 8.2 with this lower bar passage rate reduces by half his projected increase in the number of black lawyers without affirmative action.

At the matriculation stage, both Sander and we assume that the rate at which African Americans accept offers of admission would remain the same after affirmative action.<sup>121</sup> Sander and we also both believe that a higher proportion of the African American students who matriculate would go on to graduate and pass the bar, but our estimate of the improvement differs substantially from his. In our view, whatever improvement would occur would be a function of eliminating from law school most of the students with the very lowest LSATs and UGPAs, while Sander believes that the improvement would be partly a result of the elimination of those students and as much or more a function of the much better law school grades that he believes African American students would earn if they attended law schools where their entry

admissions offers. The chart below shows the way that Sander's model removed from the hypothetical class too many of the students with low indices and too few of those with high indices. For both models in the chart, total black admittees numbered 3159. Some index ranges are not shown (e.g., 460-480) because there were zero admittees in those bands under our method of calculating the midpoint index score for each of ninety cells.

2001 African American Admittees Without Affirmative Action

Note the cutoff scores separating the ranges repeat (500-520, 520-540, etc.), which follows the format in Sander's Table 8.2 spreadsheet. At a practical level, this did not cause double-counting for our grid model estimates because the index score means for the cells did not fall exactly at the cutoff (e.g., 520). We assume the same is true of Sander's calculations.

121. Actually, we expect that there would be a slightly greater drop-off between acceptances and matriculation than there is now, but we had no way to forecast, among those who could have matriculated, how many would simply decide not to apply to law school at all and how many would apply and, after being admitted, decide not to matriculate. For this reason we built into the "applicants" line in Table 4 our entire forecast of the decline we expected in matriculation among those who could have received an offer of admission to law school without affirmative action.

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1891

credentials were the same as those of their white classmates.<sup>122</sup> In the end, because of eliminating what he perceives as a mismatch, Sander forecasts a net increase of 7.9% in the number of new lawyers who would enter the bar, while we, who regard the mismatch theory as unproven and unpromising, foresee a net decline in the range of 30% to 40%.

We believe that a 30% to 40% decline in the number of African American lawyers entering the bar each year would be intolerable.

## II. THE IMPACT OF ENDING AFFIRMATIVE ACTION ON THE DISTRIBUTION OF AFRICAN AMERICAN STUDENTS AMONG LAW SCHOOLS

The huge drop we have forecast in the number of African American students who would matriculate at American law schools in a world without affirmative action would not be spread evenly across schools of all tiers. Even with his much more modest predicted decline of 14%, Sander recognizes that if affirmative action were ended, the numbers of African American students at the nation's "most elite law schools,"<sup>123</sup> currently about 8% of their student bodies, would plummet to "the range of 1 to 2%."<sup>124</sup> At the same time, Sander implies that at schools other than the most elite, the numbers of African American students would change very little: the African American students who now attend the most elite schools would instead enroll at the next-most-elite schools, those who now attend the next-most-elite would attend schools in the next group down the hierarchy, and so forth.

One of Sander's own tables strongly suggests that many more than just the most elite schools would experience a substantial decline in the number of

---

122. Even if we accept Sander's method for comparing African American performance with and without affirmative action, when we use 2004 data we calculate a 21% decline in the number of African American lawyers if affirmative action is discontinued. *See supra* Part I.A. But since Sander has failed to prove the mismatch hypothesis, a more appropriate method for computing the decline is to apply African American BPS pass rates (by index score range) to both current admittees and grid model admittees. This second approach, even though it does not incorporate our arguments about declining African American applications and yield rates (which are difficult to model), shows a drop of 30% in African American attorneys in 2004 were there not affirmative action. A related issue is that Sander's 2001 "with affirmative action" figures in Table 8.2 are based on African Americans in the BPS cohort entering law school in 1991. However, index scores for African Americans enrolled in law school have improved since 1991, particularly in the recent wave of increased admissions competition. In the 1991 BPS, 77.7% of African American enrollees had index scores of 500+, compared to 96.4% in 2004. Likewise, the percentage of African Americans with 600+ index scores improved from 41.4% in 1991 to 62.4% in 2004. This means that we would expect a higher percentage of the African Americans who began law school in 2004 to pass the bar than was the case among those in the 1991 BPS dataset, though we cannot say how great the increase would be because a few states have made the bar more difficult.

123. Sander, *supra* note 2, at 483.

124. *Id.*

African American students. In Table 3.2, Sander reports that, in 1991, at the time of the BPS, the median application index for African Americans in the fourteen first-tier schools, which was 705, was 83 points lower than the median index score for whites in the third-tier schools (the midrange public schools).<sup>125</sup> These 1991 data suggest that, without affirmative action, few African American students at first-tier schools would have had the index scores needed to be assured of admission at third-tier schools, and many would have had scores that would make admission unlikely.<sup>126</sup> Since there are a total of eighty schools in the top three tiers, it follows that many African American students who were admitted in 1991 to a first-tier school might not have been admitted that year to any of the top eighty schools. This is true even though we have seen that the typical African American student admitted to a first-tier school was an excellent bet to graduate and pass the bar.

Perhaps Sander's expectation that a substantial decline in African American students would occur at only the fourteen first-tier schools grows out of his reliance on data from 2001, when, by Wightman's calculations, many more African Americans than in 1991 could have secured admission to at least one law school without affirmative action.<sup>127</sup> It is true, as we have seen, that between 1991 and 2001, the number of white applicants declined substantially,<sup>128</sup> and the gap between white and African American entry credentials narrowed somewhat.<sup>129</sup> Yet even in 2001, it remained true that, in comparison to those of other races, few African American applicants had the sorts of entry credentials that would have assured them admission to any of the schools in the top three tiers in a completely race-blind admissions system.<sup>130</sup> By 2004, the probability of admission to the schools in the top three tiers would have diminished further for African American students because of an enormous

---

125. *Id.* at 416.

126. At the third-tier schools, the standard deviation for whites on the index was 73. *Id.* Thus, the median index for African Americans attending first-tier schools was more than a standard deviation lower than the median index for whites at third-tier schools.

127. For 1991, ten years before, Wightman had forecast that about 52.5% of African Americans who matriculated that year could not have gotten into any American law school without the help of affirmative action. When she repeated the same analysis using 2001 data, Wightman forecast that 14% of African American students would have found no law school to accept them. Wightman, *supra* note 13, at 243 tbl.7, 244 n.26.

128. See *supra* Table 1 and accompanying text.

129. In the 1992 national admissions pool, the mean African American-white gap on the LSAT was 11.4 points (on a scale of 120-180, with a standard deviation of approximately 10). By 2003, the gap had narrowed to 10.7 points. Law Sch. Admission Council, Average UGPA, Average LSAT, and Counts by Ethnic Groups—1984-85 to Fall 2003 (2004) (spreadsheets available upon request from LSAC).

130. Of the 15,421 applicants to law school in 2001 with LSAT scores of 160 or above (roughly the 83d percentile), only 254 (or 1.6%) were African American. LAW SCH. ADMISSION COUNCIL, *supra* note 16.

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1893

rise in 2002, 2003, and 2004 in the numbers of non-African American applicants with high credentials.<sup>131</sup>

It is extremely difficult to determine exactly how many law schools would experience severe declines in their numbers of African American students if affirmative action were ended, for many contingencies would be in play: the future numbers of white, African American, and other applicants; changes in admissions criteria applied by schools; changes in African Americans' admissions credentials; and so forth. What we can do, following the example of Wightman, is to model the impact of ending affirmative action on law schools at different levels by assuming a race-blind system in which law school admissions decisions are based only on LSAT scores and undergraduate grades.<sup>132</sup>

Making this assumption, Wightman applied a logistic regression model to 2001 data and estimated that, without affirmative action, African American enrollment at the first-tier schools would decline by over four-fifths and at each of the next two tiers by approximately two-thirds.<sup>133</sup> While Wightman's approach may be criticized for both over- and underestimating the probable impact of ending affirmative action at schools of different tiers,<sup>134</sup> we believe that in the case of the higher-tier schools, it provides a plausible approximation

---

131. In 2001 there were 77,235 applicants to law school, of whom 28,811 had LSATs of 155 or above. *Id.* In 2004, there were 100,604 applicants to law school, of whom 38,134 had LSAT scores of 155 or above. *Id.*

132. The picture would be essentially the same if other factors influenced admissions but, relative to LSAT scores and UGPAs, they were of small moment or distributed randomly across applicants.

133. Wightman, *supra* note 13, at 247 tbl.9.

134. It overestimates declines because it estimates the probability of acceptance only for persons who actually applied to the very school. As Sander points out, if affirmative action ended, many African Americans would probably apply to lower-tier schools than those to which they would have applied previously. On this ground, Sander calls Wightman's regression approach "nonsensical" as a basis for predicting African American enrollments. Sander, *supra* note 2, at 471 n.275. Although the indictment is extreme, the criticism has force when Wightman's model is used to estimate the overall decline in African American enrollment, but it has little force when applied to her estimates of declines in higher-tier schools, because these are the students, who, if they applied at all in a regime without affirmative action, would probably be admitted to schools in the lower tiers. In fact, in another sense, Wightman's methods in her tier-by-tier regression tend to *understate* the probable decline in African American students, especially at the second- and third-tier schools, because a person who applied and would have been accepted at a first-tier school was also counted in Wightman's regressions as having been accepted in the second or third tier if the person also applied to a school in that tier. Wightman's regression and grid models are best seen as attempts to establish upper and lower bounds on the effects of ending affirmative action. Each contains, as Wightman recognizes, unrealistic assumptions. These must be taken into account in any use of these models, but they provide no basis for adopting the one and dismissing the other as "nonsensical."

1894

STANFORD LAW REVIEW

[Vol. 57:1855]

of the likely impact that ending affirmative action would have on African American enrollments.

We made our own attempt to model the probable effects on African American enrollment by tier, and while our model is even cruder than Wightman's, it produces similar results and we believe fairly illustrates the sorts of effects that ending affirmative action might have. Using 2003 admissions data and *U.S. News* rankings,<sup>135</sup> we divided law schools into groups by rank. We then combined LSAT scores and UGPA into an index following Sander's formula and assumed that all the first-year places available at the top ten schools would be filled by the students with the highest admission indices, that all places at the eleventh through twenty-fifth schools would be filled by those with the next highest indices, and so forth.<sup>136</sup> Table 5, in Line B, presents the results of our model. In each of the top three ranges of schools, fewer than two percent of the students would be African American.

TABLE 5: AFRICAN AMERICAN ENROLLMENTS AT U.S. LAW SCHOOLS IN 2003 IF LSAT AND UGPA WERE THE SOLE CRITERIA FOR SELECTION

	Range of Law Schools	Top 10	11th-25th	26th-50th	51st-100th	Group 3	Group 4
A	Estimated Number of African American Students	23	44	99	292	263	574
B	Estimated % of Student Body Who Would Be African American	0.75%	1.01%	1.68%	2.38%	3.72%	4.69%
C	Doubling B to Account for Factors Other than LSATs and UGPA	1.50%	2.02%	3.36%	5.74%	7.44%	9.38%

Source: LAW SCH. ADMISSION COUNCIL, *supra* note 16.

The results in Table 5, Line B are low—unrealistically low—because not all students apply to the highest-tier law school that will admit them, and because no law schools simply admit all the highest-scoring applicants. It is this attention to other factors, specifically applicants' race and ethnicity, that has characterized affirmative action, but even apart from their race, one might expect many African American applicants to have distinguishing life

135. See *Schools of Law*, *supra* note 33, at 69. Admittedly, these rankings are controversial and warrant criticism. Richard O. Lempert, *Of Polls and Prestige: One Faculty Member's Candid Views*, 34 LAW QUADRANGLE NOTES, Fall 1990, at 62, 68 (criticizing the *U.S. News* rankings). However, our options are limited because, for confidentiality reasons, none of the LSAC-BPS publications identifies the law schools in the six clusters that Wightman devised.

136. We are grateful to Josiah Evans, research associate at the Law School Admission Council, for preparing this table.

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1895

experiences or skills that would lead a school to want to enroll them. We don't know how many this would be, but let us assume line B is low by a factor of two, because African American applicants were stronger than other applicants on nonindex credentials (or because applicants of other races with high admission indices disproportionately chose to attend lower-tier schools). Reflecting this assumption, line C in the table *doubles* the percentages in Line B.<sup>137</sup> Even with doubling, only 1.5% of the students at the top ten schools, 2.0% of those at the next fifteen schools, and 3.4% of those at the next twenty-five schools would be African American. Taken together, at the top fifty schools, African Americans would, in 2003, have constituted only about 2.5% of admitted students, a number that is down by about two-thirds from their actual numbers and close to Wightman's estimated drop for schools below the very top.

Consider the implications of a decline of this scale. If African Americans constituted only 2.5% of the student bodies of these schools, rather than the roughly 8% that they represent today, then a law school that had eighty students in each of four first-year sections would have, on average, only two African American students in each section after the end of affirmative action. This compares to the six or seven African American students in each such section today.

With declines of this magnitude, three harmful consequences are likely to occur at the affected law schools. First, some very able African Americans who would not want to be part of a tiny racial minority would decide not to apply to any of these schools, further reducing the numbers of African American students.<sup>138</sup> Second, those few who did matriculate would likely feel conspicuous and isolated, participate less in class, and otherwise contribute less to the intellectual life around them.<sup>139</sup> And third, white students at these schools would lose the opportunity to learn from and interact with African

---

137. We have no data that indicates that African American students would, apart from their race, be more attractive to law school admissions officers than white, Asian, or Hispanic students, though we think it plausible that some experiences linked to their race would cause them disproportionately to stand out as applicants who would make for a more well-rounded class, at least as compared to white students. We may be generous in assuming their attractive features apart from race would double their chances of admission.

138. See *supra* text accompanying notes 31-32.

139. Patricia Gurin et al., *Diversity in Higher Education: Theory and Impact on Educational Outcomes*, 72 HARV. EDUC. REV. 330, 360 (2002) ("The worst consequence of the lack of diversity arises when a minority student is a token in a classroom. In such situations, the solo or token minority individual is often given undue attention, visibility, and distinctiveness, which can lead to greater stereotyping by majority group members."). A study including focus groups and surveys found underrepresented minority students encountered these sorts of problems at UC Berkeley after Proposition 209. Daniel Solorzano et al., *Keeping Race in Place: Microaggressions and Campus Racial Climate at the University of California, Berkeley*, 23 CHICANO-LATINO L. REV. 15 (2002).

American students.<sup>140</sup> We live in a multiracial society, but one that still endows race with great social significance.<sup>141</sup> Racial understanding comes in significant part from actual interaction.

Other, broader societal harms would also flow from cutting African American enrollments by over two-thirds at the most selective fifty or eighty law schools. As the majority opinion in *Grutter* recognized, the nation's top law schools produce a disproportionate share of the leaders of the American bar, of elected and appointed officials, and of policymakers and opinion shapers in the country.<sup>142</sup> Over the past thirty years, because of affirmative action, thousands of African Americans have graduated from elite and near elite schools, which has helped them open the doors needed to become part of the next generation of leaders.<sup>143</sup> The elimination of affirmative action admissions at the nation's elite law schools would thus be likely to substantially diminish African American representation in such leadership positions as partners in corporate law firms,<sup>144</sup> professors teaching at law schools,<sup>145</sup> and federal judges.<sup>146</sup> Of course, many white and minority leaders

145. For example, of the 604 African American law professors in the latest *AALS Directory*, 48.1% graduated from the law schools ranked first through tenth in *U.S. News*, and 60.1% graduated from the law schools ranked first through twentieth. (This claim, and others in this note, is based on the authors' calculations using data from ASS'N OF AM. LAW SCH., *THE AALS DIRECTORY OF LAW TEACHERS, 2003-04* (2004).) An additional 13.1% had other advanced degrees from elite schools (a J.S.D. or LL.M. from Stanford, etc.), and analysis of African American professors at the top seventy-five law schools (n = 266) indicated that 74.4% graduated from the top twenty law schools. We are not arguing that all these professors directly benefited from an affirmative action "plus factor," nor are we arguing that none would have become professors had they attended lower-ranked schools in the absence of affirmative action. What is clear, however, is that law school prestige matters a great deal in the law teaching market. See also Robert J. Borthwick & Jordan R. Schau, *Gatekeepers of the Profession: An Empirical Profile of the Nation's Law Professors*, 25 U. MICH. J.L. REFORM 191, 227 tbl.27 (1991) (showing, in study of 872 law professors, that 60% graduated from the top twenty-five schools).

146. African Americans were 10.7% of all active Article III federal judges last year. ADMIN. OFFICE OF THE U.S. COURTS, *THE JUDICIARY FAIR EMPLOYMENT PRACTICES ANNUAL REPORT* 23 tbl.1A (2003). Of the 104 African American judges for whom we could obtain

May 2005] *IMPACT OF ELIMINATING AFFIRMATIVE ACTION* 1897

have also attended law schools farther down the *U.S. News* rankings, but the range of career opportunities is simply narrower at the less prestigious schools, and it is harder to rise to positions of prominence.

It is at the most elite schools where the effects on the white and minority students of ending affirmative action would be most unambiguously harmful. As we saw earlier, African Americans at first-tier schools graduate and pass the bar at *higher* rates than African Americans with the same credentials at schools in the lower tiers.<sup>147</sup> Other evidence suggests that they earn higher incomes than the graduates of lower tiers.<sup>148</sup> They are quite unlikely to regard themselves as the victims of affirmative action. Thus, ending affirmative action would offer no benefits to these students and cause a substantial loss both to them and to the white and other students attending top-tier schools.

Near the end of his article, Sander proposes, as an alternative to ending affirmative action altogether, that law schools “only use preferential admissions preferences for blacks to the extent necessary to prevent black enrollments from falling below 4% of total enrollment.”<sup>149</sup> Whatever else might be said of this recommendation, it would produce harm at the most elite schools, because it would deprive roughly half of the African American students who attend these schools today of an education they have been putting to very good use. Indeed, in the case of elite schools, Sander’s recommendation seems directed at a problem that does not exist. The bar passage data that Sander analyzes, the After the JD data he also examines, and a close examination of the graduates of one elite law school<sup>150</sup> reveal no important differences between African American and white students with respect to graduation rates, bar passage rates given graduation, and measured career success.

#### CONCLUSION

Over the past thirty-five years, the system of affirmative action has permitted tens of thousands of African Americans to enter the American bar. Yet in the 1991 admissions cohort, for every three African Americans who

---

data, over 40% were graduates of the top twenty law schools. Our data here were compiled from AM. BAR ASS’N, *THE DIRECTORY OF MINORITY JUDGES OF THE UNITED STATES* (3d ed. 2001), together with AIMEE S. MANGAN, *JUDICIAL YELLOW BOOK*, at <http://www.law.umich.edu/currentstudents/careerservices/pdf/Appendixb.pdf> (online version available to subscribers at University of Michigan Law School and most law school libraries). Over 90% of these judges graduated from law school in the 1950s, 1960s, or 1970s.

147. At these Tier 1 schools, whites in the BPS graduated at higher levels than African Americans and passed the bar at slightly higher rates than African Americans, but Sander has been unable to prove that “mismatch” is the reason for the difference.

STANFORD LAW REVIEW

[Vol. 57:1855]

became lawyers, two others started law school but never graduated, or graduated but never passed the bar. This high rate of dropout and bar failure, much higher than for whites, is a very serious problem that almost certainly continues today.

As H.L. Mencken observed, “for every problem, there is a solution that is simple, neat and wrong.”<sup>151</sup> In his conclusion, Sander claims that “the production of black lawyers would rise significantly in a world without racial preferences,” because African American law students, no longer “mismatched” at the schools they attend, would graduate and pass the bar at much higher rates.<sup>152</sup> His conclusions are simple, neat, and wrong. As we have demonstrated here, they rest on a seriously flawed appraisal of the current evidence. We believe that, using the same evidence, we have demonstrated just the opposite: that, without affirmative action, both the enrollment of African American law students (particularly at the fifty or eighty most selective schools) and the production of African American lawyers would significantly decline. Sander has not made his case for the effects of a “mismatch.” Our ultimate conclusion is simple but sound: Sander’s article does not deserve the attention it has attracted. Too much of it is simply wrong.
